## Preface

## Chapter 1

### Pre-install Considerations

Introduction .....	22
Before you begin .....	22
General tasks .....	22
UNIX-specific tasks .....	22
Windows-specific tasks .....	23
z/OS-specific tasks .....	23
Linux on System z-specific tasks .....	25
SYMAPI home directory .....	26
Interoperability information .....	26
Solutions Enabler .....	27
SMI-S Provider .....	27
Environment and system requirements .....	29
Solutions Enabler .....	29
VSS Provider .....	32
SMI-S Provider .....	38
z/OS-specific requirements .....	39
Backward/forward compatibility for applications .....	41
Storage systems .....	41
Client or server installation .....	44
Remote connection .....	44
Client/server IP communication .....	44
Client/server security .....	45
Client/server system installation .....	45
Installation checklist .....	46
Windows installation check list .....	47
UNIX installation check list .....	48

## Chapter 2

### Installation

Installing Solutions Enabler on UNIX and Linux .....	52
Step 1: Download the installation package .....	52
Step 2: Run the install script .....	52
Step 3: Select the installation directories .....	56
Step 4: Select installation options .....	57
Step 5: Complete the installation .....	59
Installing Solutions Enabler on Windows .....	61
Using the InstallShield wizard .....	61
Using the command line .....	64
Using a response file .....	67
Installing Solutions Enabler on z/OS .....	68
Step 1: Copy the files .....	68
Step 2: Receive the transmit file .....	69
Step 3: Extract the additional files from the XMITLIB .....	69
Step 4: Customize the JCL .....	70
Step 5: Run the jobs .....	72
Step 6: Manage z/OS Lockbox password .....	74

Step 7: Complete the installation .....	78
Starting over .....	78
Restoring the RIMLIB .....	79
Installing Solutions Enabler on OpenVMS.....	79
Step 1: Accessing the software.....	79
Step 2: Install the software.....	79
Installing Solutions Enabler on Solaris 11 Local Zones .....	82
Upgrading SMI-S Provider.....	83

### Chapter 3 Post-Install for UNIX, Windows, and OpenVMS

Licensing your software.....	86
Licenses.....	86
Managing arrays running different Engenuity versions.....	96
Capacity measurements.....	97
Installing array-based licenses .....	101
Installing host-based licenses.....	102
Displaying licenses .....	102
Querying licenses.....	107
Deleting licenses.....	110
Initial steps for post-install of Solutions Enabler.....	110
Building the SYMAPI database .....	110
Setting environment variables.....	110
Setting access permissions to directories.....	111
Starting the SCSI generic driver .....	111
Verifying the existence of dedicated gatekeepers .....	111
Setting the CLI path.....	111
Setting the online help path.....	112
Managing database and gatekeeper locking.....	112
Semaphore requirements on UNIX.....	112
Meeting semaphore requirements.....	113
Refreshing the semaphores.....	113
De-allocating semaphores.....	113
Windows locking.....	113
Avoidance and selection files.....	113
Editing and file format .....	114
gkavoid and gkselect .....	114
inqfile .....	114
symavoid .....	115
Changing the default behavior of SYMCLI .....	115
Editing the options file .....	115
Removing default options .....	116
Options file parameters.....	116
Oracle multiple instances through a remote server .....	116
Client/server RDBMS environment variable behavior.....	116
Setting up daemons for distributed application support.....	117
Starting daemons.....	118
Stopping daemons.....	118
Viewing daemons.....	119
Setting daemons to auto-start on boot .....	119
Authorizing daemon connections .....	119
Controlling daemon behavior .....	120
Controlling daemon logging .....	121
Managing the base daemon .....	122
Starting the base daemon .....	122

Stopping the base daemon .....	122
Setting the optional base daemon behavior parameters.....	123
Setting up the event daemon for monitoring.....	123
Event sources.....	124
Threshold events.....	125
Starting the event daemon .....	126
Reloading the daemon_options settings .....	126
Listing supported event categories.....	126
Stopping the event daemon .....	127
Configuring event logging.....	127
Event output examples.....	134
Event message formats .....	135
Miscellaneous options .....	145
Test mode .....	145
VSS Provider environment variables .....	146
SMI-S Provider Windows authentication settings .....	146
VMAX arrays.....	146
ECC and Unisphere for VMAX 1.0 coexistence: symapi_db.bin database sharing .....	147
ECOM.....	147
Setting up administrator authentication .....	147
ECOM certificate management .....	148
Starting and stopping ECOM .....	149
SMI-S Provider runtime settings .....	150
RedHat Enterprise Linux 6.0/6.2 [GA] - x86_64 installation.....	151
Adding the SSL certificate .....	152
Vendor SNIA libraries needed for HBA information .....	153

## Chapter 4 Remote Operations

SYMCLI through a remote server.....	156
Client configuration.....	156
Editing the netcnfg file .....	156
Considerations for specifying server_node_name and server_network_address .....	159
Setting environment variables for remote access.....	160
Client/server IP interoperability.....	161
IPv6 addresses.....	161
IPv4 address mapping.....	161
Server operation .....	162
Client operation .....	162
Client/server security.....	163
Specifying server behavior .....	163
Controlling the server.....	165
Starting the server.....	165
Stopping the server.....	165
Showing server details .....	165
Displaying networking information .....	167
Reloading the daemon_options file.....	167
Summarize active SYMAPI sessions .....	167
Show session details .....	167
Controlling and using the storsrvd log files.....	168
Numbered messages issued by storsrvd .....	169

<b>Chapter 5</b>	<b>Post-Install for z/OS</b>	
	SYMAPI server security preparation .....	172
	Started task user identity .....	172
	Installing SSL certificates .....	172
	Configuring Solutions Enabler .....	173
	SYMAPI database support .....	173
	Server default database locking .....	174
	Gatekeeper devices.....	174
	Configuring for local time zone .....	177
	Modifying default behavior with the options file .....	178
	Remote control operations .....	178
	Restricting remote control operations.....	178
	Controlling the server.....	181
	Starting the server.....	181
	Stopping the server.....	182
	Using the console .....	182
	Using stordaemon TSO commands.....	184
	Using stordaemon in a USS shell.....	184
	Running the base daemon on z/OS .....	185
	Starting the base daemon .....	185
	Stopping the base daemon .....	185
	Using and configuring the base daemon .....	185
	Base daemon logging.....	186
	Avoidance and selection files and the base daemon .....	186
	Running the event daemon on z/OS .....	186
	Starting the event daemon .....	186
	Stopping the event daemon .....	187
	Using and configuring the event daemon .....	187
	Event daemon logging.....	187
<b>Chapter 6</b>	<b>Technical Notes and Configuration</b>	
	Solutions Enabler technical notes .....	190
	Changes to default port flag settings .....	190
	VSS Provider technical notes.....	193
	Enable debugging for VSS Provider .....	193
	Log file.....	193
	Registry keys.....	193
	Remote snapshots .....	196
	Enforcing a strict BCV rotation policy .....	196
	Enforcing a mapped device policy .....	196
	Using SymmetrixStaticMount to disable LUN masking and unmasking .....	197
	Enforcing TimeFinder Clone as default plex snapshot technology .....	197
	Enforcing a clone retention policy.....	197
	Enforcing TimeFinder VP Snap as default differential snapshot technology.	197
	Enforcing a VP Snap retention policy .....	198
	Enforcing SnapVX as default snapshot technology on HYPERMAX OS 5977	198
	LUN resynchronization .....	198
	VSF (Veritas Storage Foundation) 5.1 SP1 for Windows .....	199
	Windows Server 2008 R2 CSV (Cluster Shared Volumes) .....	199
	Windows Server 2012 or 2012 R2 CSV .....	199
	Using DPM to back up virtual machines deployed on CSV.....	199
	SMI-S Provider technical notes .....	199

Global mode .....	199
CIM interop namespace .....	199
Unexpected termination: Windows dump file .....	199
Statistics collection interval .....	200
Logging in with the LDAP user .....	200
SMI-S Provider user roles .....	200
Linux on System z technical note.....	201
HBA libraries .....	201
z/OS technical notes.....	201
Thread dumps in the zOS server .....	201
#04DDDEF .....	202
#05RECEV .....	202
#12CNTRL .....	202
STEPLIB APF authorization.....	202
Disabling control functions .....	202
Security considerations if you do not disable control functions .....	203
HP-UX technical note.....	203
HP applications link-edited with prior versions of Solutions Enabler....	203
OpenVMS technical note .....	203
Hyper-V technical notes .....	203
Hyper-V Server setup.....	204
Hyper-V gatekeepers .....	204
SIU support for Hyper-V guest OS .....	204
SIU support for multiple log files .....	205
Virtual Appliance technical notes .....	205
Linux only support when using ovftool .....	205
Daemon behavior during import/export operations.....	205
Login page cursor not focused.....	205
Server hostname requirement .....	205
SSL certificate generation.....	205
Gatekeeper devices.....	205
Host ESX Server configuration .....	206
SMC daemon service.....	206
Flash Player version .....	206
Changing the IP address.....	206
SYMCLI commands executed/submitted as root.....	206
Least privileged permission requirements .....	206
<b>Chapter 7</b>	<b>Gatekeeper Devices</b>
Overview.....	208
How SYMCLI uses gatekeepers .....	208
Gatekeeper candidates .....	208
Using the gkavoid and gkselect files .....	209
Sizing gatekeepers.....	209
VMware setup .....	210
Creating gatekeeper devices .....	211
Displaying gatekeeper information .....	212
Displaying gatekeeper statistics.....	212
Displaying gatekeeper candidates and gatekeeper states .....	213
<b>Chapter 8</b>	<b>Uninstalling Solutions Enabler</b>
Overview.....	216
Stopping the application processes .....	216

Uninstalling the software .....	216
Uninstalling Solutions Enabler from UNIX .....	216
Using the script.....	217
Using native tools .....	217
Uninstalling Solutions Enabler from Windows .....	219
Using the InstallShield wizard .....	219
Using the command line.....	219
Removing the msi image .....	220
Using the Windows Add/Remove Programs dialog.....	221
Using the Windows Programs and Features dialog.....	221
Uninstalling Solutions Enabler from OpenVMS .....	221
Rolling back an upgrade.....	221

**Chapter 9 Installing the Solutions Enabler Virtual Appliance**

Introduction .....	224
Before you begin .....	224
Installing the virtual appliance directly to the ESX Server.....	225
Step 1: Import the virtual appliance .....	225
Step 2: Select gatekeepers.....	226
Step 3: Power on and configure the Virtual Appliance.....	226
Installing the virtual appliance through a vCenter Server .....	228
Step 1: Import and configure the virtual appliance .....	228
Step 2: Select gatekeepers.....	229
Step 3: Power on the virtual appliance .....	229
Installing the virtual appliance using OVFTOOL .....	229
Using OVFTOOL .....	230
Launching vApp Manager .....	231
Registering VASA Provider with vSphere .....	231
Updating the Solutions Enabler Virtual Appliance.....	232
Updating from an ISO image.....	232
Reconfiguring virtual appliance IP Address.....	233
Deleting the Solutions Enabler Virtual Appliance .....	234

**Appendix A SYMAPI Server Daemon Messages**

Message format .....	236
Messages .....	237

**Appendix B Asynchronous Events**

Array event codes.....	264
Classes of Events .....	264
Severity Calculation for status/state events .....	265
Event daemon events: Event IDs 0-199.....	265
1 .....	265
2 .....	266
3 .....	266
Array Events: Event IDs 1050 - 1199.....	266
Array Events: Event IDs 1200-1999.....	267
1200.....	267
1201.....	268
1202.....	268
1203.....	269
1204.....	270
1205.....	271

1206 ..... 271

1207 ..... 272

1208 ..... 272

1209 ..... 273

1210 ..... 274

1211 ..... 274

1212 ..... 275

1213 ..... 275

1214 ..... 276

1215 ..... 276

1216 ..... 277

1217 ..... 277

1218 ..... 278

1219 ..... 278

1220 ..... 279

1230 ..... 279

1231 ..... 279

1232 ..... 280

1233 ..... 280

1234 ..... 280

# PREFACE

*As part of an effort to improve its product lines, EMC periodically releases revisions of its software and hardware. Therefore, some functions described in this document might not be supported by all versions of the software or hardware currently in use. The product release notes provide the most up-to-date information on product features.*

*Contact your EMC representative if a product does not function properly or does not function as described in this document.*

---

**Note:** This document was accurate at the time of publication. New versions of this document might be released on the EMC Online Support. Check the EMC Online Support to ensure that you are using the latest version of this document.

---

## Purpose

This document describes how to install and configure EMC® Solutions Enabler software.

## Audience

This guide provides installation procedures for installing the EMC Solutions Enabler software for your specific platform. The EMC Solutions Enabler software provides your host system with an API shared library and a special command set that comprises the Symmetrix® Command Line Interface (SYMCLI). (For the z/OS platform, only the SYMAPI server is available.)

## Related documentation

The following documents provide additional information about Solutions Enabler:

- ◆ *EMC Solutions Enabler v8.0.3 Release Notes* — Identifies known functionality restrictions and performance issues that may exist with the current version and your specific storage environment.
- ◆ *EMC Solutions Enabler CLI Command Reference* — Documents the SYMCLI commands, daemons, error codes and option file parameters provided with the Solutions Enabler man pages.
- ◆ *EMC Solutions Enabler Array Management CLI User Guide* — Describes how to configure array control, management, and migration operations using SYMCLI commands.
- ◆ *EMC Solutions Enabler SRDF Family CLI User Guide* — Describes how to configure and manage SRDF environments using SYMCLI commands.
- ◆ *EMC Solutions Enabler TimeFinder Family CLI User Guide* — Describes how to configure and manage TimeFinder environments using SYMCLI commands.
- ◆ *EMC Solutions Enabler SRM CLI User Guide* — Provides Storage Resource Management (SRM) information related to various data objects and data handling facilities.
- ◆ *EMC VMAX Family Security Configuration Guide* — Describes how to configure VMAX Family security settings.

The following provide additional information:

- ◆ *EMC VMAX3 Family Documentation Set* — Contains documentation related to the VMAX 100K, 200K, and 400K arrays.
- ◆ *EMC VMAX Family Documentation Set* — Contains documentation related to the VMAX 10K, 20K, and 40K arrays.
- ◆ *EMC VMAX3 Family with HYPERMAX OS Release Notes* — Detail new features and any known limitations.
- ◆ EMC VMAX Family Viewer for Desktop and iPad® — Illustrates system hardware, incrementally scalable system configurations, and available host connectivity offered for VMAX arrays.
- ◆ E-Lab Interoperability Navigator — You can find the Interoperability Navigator at <http://elabnavigator.EMC.com>.
- ◆ SOLVE Desktop — Provides procedures for common tasks and supported SRDF features. To download the SOLVE desktop tool go to EMC Online Support at <https://support.EMC.com> and search for SOLVE Desktop. Download the Desktop and load the VMAX Family and DMX procedure generator.

## Conventions used in this document

EMC uses the following conventions for special notices:

**CAUTION**, used with the safety alert symbol, indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

**Note:** A note presents information that is important, but not hazard-related.

### **IMPORTANT**

An important notice contains information essential to software or hardware operation.

## Typographical conventions

EMC uses the following type style conventions in this document:

<b>Normal</b>	<p>Used in running (nonprocedural) text for:</p> <ul style="list-style-type: none"> <li>• Names of interface elements, such as names of windows, dialog boxes, buttons, fields, and menus</li> <li>• Names of resources, attributes, pools, Boolean expressions, buttons, DQL statements, keywords, clauses, environment variables, functions, and utilities</li> <li>• URLs, pathnames, filenames, directory names, computer names, links, groups, service keys, file systems, and notifications</li> </ul>
<b>Bold</b>	<p>Used in running (nonprocedural) text for names of commands, daemons, options, programs, processes, services, applications, utilities, kernels, notifications, system calls, and man pages</p> <p>Used in procedures for:</p> <ul style="list-style-type: none"> <li>• Names of interface elements, such as names of windows, dialog boxes, buttons, fields, and menus</li> <li>• What the user specifically selects, clicks, presses, or types</li> </ul>

<i>Italic</i>	Used in all text (including procedures) for: <ul style="list-style-type: none"> <li>• Full titles of publications referenced in text</li> <li>• Emphasis, for example, a new term</li> <li>• Variables</li> </ul>
Courier	Used for: <ul style="list-style-type: none"> <li>• System output, such as an error message or script</li> <li>• URLs, complete paths, filenames, prompts, and syntax when shown outside of running text</li> </ul>
<b>Courier bold</b>	Used for specific user input, such as commands
<i>Courier italic</i>	Used in procedures for: <ul style="list-style-type: none"> <li>• Variables on the command line</li> <li>• User input variables</li> </ul>
< >	Angle brackets enclose parameter or variable values supplied by the user
[ ]	Square brackets enclose optional values
	Vertical bar indicates alternate selections — the bar means “or”
{ }	Braces enclose content that the user must specify, such as x or y or z
...	Ellipses indicate nonessential information omitted from the example

## Where to get help

EMC support, product, and licensing information can be obtained on EMC Online Support, as described next.

---

**Note:** To open a service request through EMC Online Support, you must have a valid support agreement. Contact your EMC sales representative for details about obtaining a valid support agreement or to answer any questions about your account.

---

### Product information

For documentation, release notes, software updates, or for information about EMC products, licensing, and service, go to EMC Online Support (registration required) at:

<https://support.EMC.com>

### Technical support

EMC offers a variety of support options.

**Support by Product** — EMC offers consolidated, product-specific information on the Web at:

<https://support.EMC.com/products>

The Support by Product web pages offer quick links to Documentation, White Papers, Advisories (such as frequently used Knowledgebase articles), and Downloads, as well as more dynamic content, such as presentations, discussion, relevant Customer Support Forum entries, and a link to EMC Live Chat.

**EMC Live Chat** — Open a Chat or instant message session with an EMC Support Engineer.

### **eLicensing support**

To activate your entitlements and obtain your license files, visit the Service Center on <https://support.EMC.com>, as directed on your License Authorization Code (LAC) letter emailed to you.

For help with missing or incorrect entitlements after activation (that is, expected functionality remains unavailable because it is not licensed), contact your EMC Account Representative or Authorized Reseller.

For help with any errors applying license files through Solutions Enabler, contact the EMC Customer Support Center.

If you are missing a LAC letter, or require further instructions on activating your licenses through the Online Support site, contact EMC's worldwide Licensing team at [licensing@emc.com](mailto:licensing@emc.com) or call:

- ◆ North America, Latin America, APJK, Australia, New Zealand: SVC4EMC (800-782-4362) and follow the voice prompts.
- ◆ EMEA: +353 (0) 21 4879862 and follow the voice prompts.

### **Your comments**

Your suggestions will help us continue to improve the accuracy, organization, and overall quality of the user publications. Send your opinions of this document to:

# CHAPTER 1

## Pre-install Considerations

This chapter explains the tasks that you should perform before installing Solutions  
Enabler:

- ◆ Introduction ..... 22
- ◆ Before you begin ..... 22
- ◆ Interoperability information ..... 26
- ◆ Environment and system requirements ..... 30
- ◆ Client or server installation ..... 44
- ◆ Installation checklist ..... 46

## Introduction

An EMC Solutions Enabler install provides your host with SYMAPI, CLARAPI, and STORAPI shared libraries for use by Solutions Enabler applications, and the Symmetrix Command Line Interface (SYMCLI) for use by storage administrators and systems engineers.

SYMCLI is a specialized library of UNIX-formatted commands that can be invoked one at a time. It supports single command line entries and scripts to map and perform control operations on devices and data objects toward the management of your storage complex. It also monitors device configuration and status of devices that make up the storage environment. The target storage environments are typically VMAX arrays.

## Before you begin

Before you begin to install Solutions Enabler, be sure to complete the tasks listed in this section.

### General tasks

The following tasks apply to all supported platforms:

- ❑ Obtain the software. Solutions Enabler is distributed as a platform-specific file download from the EMC Online Support at <https://support.EMC.com>
- ❑ Review the interoperability information in the E-Lab™ Interoperability Navigator which can be reached at <http://elabnavigator.EMC.com>
- ❑ Review the *EMC Solutions Enabler v8.0.3 Release Notes*.
- ❑ If you are upgrading from a previous version, verify that all application processes that use the Solutions Enabler libraries and binaries are stopped. “[Stopping the application processes](#)” on page 216 provides instructions.
- ❑ If you are upgrading from a previous version, create copies of the host database and configuration directories. These copies will be useful should you want to roll back to the previous version of Solutions Enabler. The location of these directories vary according to the operating system. [Appendix E, “Solutions Enabler Directories”, on page 323](#) provides more information.
- ❑ EMC recommends that you read the *EMC VMAX Family Security Configuration Guide* and apply the settings after installation.

### UNIX-specific tasks

The following task is specific to UNIX environments:

- ❑ AIX does not allow changes to the destination path during installation. All binaries and libraries are installed under `/opt/emc`.

If there is insufficient disk space under `/opt`, create a soft link to `/opt/emc/` as shown below and then run the installer:

```
ln -s NewInstallationDir /opt/emc
```

The root user must have write permission on the *NewInstallationDir*.

## Windows-specific tasks

Before starting the installation process, all Windows applications should be closed. This includes Windows Services and the Windows Event Viewer.

During the installation process, the **Service List** dialog will open so you can select the daemons to start. You can prepare for this by reading the section [“Setting up daemons for distributed application support” on page 117.](#)

## z/OS-specific tasks

The following tasks are specific to z/OS Mainframe environments:

- Verify that you have a Windows host running a version of PKZIP or WinZip that supports 2.04 G compression.

You will need the Windows host to FTP the installation files to the z/OS host.

- Install ResourcePak<sup>®</sup> Base.

Solutions Enabler requires the use of EMC ResourcePak Base version 7.6.0 at a minimum. However, as ResourcePak versions go out of support, you should upgrade to a version that supports your requirements.

If you have already installed ResourcePak Base Version 7.6.0 or higher as part of another product installation, you do not need to re-install it. However, you should ensure that all recommended maintenance is applied.

- Choose an installation/configuration user account.

To run the installation jobs, you must choose a TSO account in your system that has an OMVS segment defined in the security database. Since Solutions Enabler runs with the IBM Language Environment option POSIX(ON), the software requires that you either have a base OMVS segment defined or have access to an installation default profile. Before running any Solutions Enabler jobs, ensure that you have a correctly defined the OMVS segment.

You should use this user’s high-level qualifier when uploading the Solutions Enabler distribution file from the installation to the host.

For more information on defining OMVS segments, see the IBM publication *z/OS Security Server RACF Security Administrators' Guide*.

- Gather the following customization information:

- Solutions Enabler dataset name prefix

Choose the prefix for all the product data sets to be allocated for the installation. The prefix includes the high-level qualifier and all secondary qualifiers except the last. For example, if you choose the default EMC.SSEM803 as the prefix, you will allocate EMC.SSEM803.LOADLIB, EMC.SSEM803.PARMLIB, and so on.

---

**Note:** This should be the same prefix as the one you choose when you upload the distribution file from the installation CD.

---

- SMP/E dataset name prefix

Identify the prefix for the SMP/E datasets of the environment into which you have installed or will install the ResourcePak Base (EMCSCF). The default value is `EMC.SMPE`, which is the default for the ResourcePak Base product.

- SCF subsystem ID

The EMCSCF server address space uses a z/OS subsystem identifier (SSID) to make itself known to applications that use its services. Solutions Enabler must have the same SCF SSID as the ResourcePak Base started task that you require it to use. The default is `EMC`.

- SCF linklib prefix

Identify the prefix for the product datasets into which you have installed or will install the ResourcePak Base (EMCSCF) version 7.6.0 or higher. The default value is `EMC.SSCF720`, which is the default for the ResourcePak Base product, version 7.2.0. The EMCSCF Linklib will be added to the STEPLIB DD statement of the Solutions Enabler execution JCL.

- Disk unit name and volume serial

Choose the unit name and a corresponding disk volume serial where you will install the Solutions Enabler product datasets. The default for unit name is `SYSDA`; there is no default for the volume serial.

- SYMAPI base directory

Specify a Unix System Services directory under which SYMAPI runtime sub directories will be created.

By default, the SYMAPI base directory is `/var/symapi`. However, during the execution of the Solutions Enabler SEMJCL installation procedure, you can change the default to any directory you want, provided that the security settings for the userids that run the Solutions Enabler jobs have read/write/execute permissions for the entire SYMAPI base directory tree.

- SYMAPI base directory space requirements

The space requirements for the SYMAPI base directory vary according to the activities requested by clients (such as EMC Unisphere for VMAX) of the Solutions Enabler tasks. In addition, the logging options (type, detail, retention period) you select will also affect the space requirements for the SYMAPI base directory. In most cases, 50 to 100 MB should be sufficient.

If you intend to configure the server to use `SYMAPI_LE_DUMP_LOGDIR`, you should consider providing additional space. For more information on `SYMAPI_LE_DUMP_LOGDIR`, refer to [“ANR0222E” on page 259](#).

- Time zone

The time stamp on messages written by Solutions Enabler to its internal logs will use the Portable Operating System Interface (POSIX) default—normally Coordinated Universal Time (UTC). If you prefer a local time stamp, you will need to provide a POSIX-compliant time zone value.

[“Configuring for local time zone” on page 177](#) provides more information.

- ❑ Define the UNIX system services requirements:

The following requirements apply to the userid of the installer which is the userid assigned to the started tasks or batch jobs used to run Solutions Enabler tasks such as the SYMAPI server and event daemon. All userids running Solutions Enabler tasks must have an OMVS segment and full read/write/execute permissions to the SYMAPI base directory (by default `/var/symapi`) and all the sub-directories.

---

**Note:** Throughout the rest of this manual, this directory will be referred to as the *`symapi_installation_directory`*.

- Define the OMVS segment requirement

When you are configuring Solutions Enabler JCL and your system to execute the SYMAPI server, you may need to add definitions to your local security system.

If you are using IBM RACF, you may see message ICH408I when the server initializes. If you do, you must define an OMVS segment for the user or users who will run the server job. The following sample message assumes the job name and step name of the server are SEMAGENT:

```
*ICH408I JOB(semagent) STEP(semagent) CL(process) OMVS SEGMENT
NOT DEFINED
```

If you are running the server as a started task, the user identity associated with the STC must have an OMVS segment defined. This is also true for the userid assigned to the batch job running the server (if you choose to run it that way).

---

**Note:** For information on defining an OMVS segment for each user, refer to the IBM publication *z/OS Security Server RACF Security Administrator's Guide*.

In addition, the userids must have full read/write permissions for the entire directory tree (specified during the install) of the *`symapi_installation_directory`*.

If these permissions are not granted to the installer or the SYMAPI tasks, then various security error messages may be issued during the the install or server setup.

For example:

```
ICH408I USER(user) Group(group) Name(username) 035
035 /var/symapi CL(DIRACC ) FID(01C8C6E2F0F0F200010D00000000003)
035 INSUFFICIENT AUTHORITY TO MKDIR
035 ACCESS INTENT(-W-) ACCESS ALLOWED(OTHER R-X)
035 EFFECTIVE UID(0000888888) EFFECTIVE GID(0000000900)
```

## Linux on System z-specific tasks

The following tasks are specific to Linux for IBM System z environments:

---

**Note:** Once you have completed the tasks in this section, continue with the UNIX installation procedure in [Chapter 2](#), followed by the procedure [“Installing the Linux I/O module for CKD devices” on page 60](#).

- ❑ Verify that you have a supported version of Linux for System z.

- ❑ Verify that the installer is using root during both pre -and- post installation phases.
- ❑ If Linux on System z is running as a guest under IBM's z/VM:
 

Verify that all VMAX CKD devices are defined as z/VM unsupported DASD and attached to the Linux guest. The devices must be defined to z/VM (by way of SET RDEV) as:

```
TYpe UNSUPported DEVClass DASD DPS Yes RESERVE_RELease Yes
```

For example:

```
Set RDEvice 1300 TYpe UNSUPported DEVClass DASD DPS Yes
RESERVE_RELease Yes
```

By default, these devices will all function as gatekeepers. However, you can individually manage them by way of the gatekeeper select/avoid configuration files, as required.

MVS formatted devices (regular MVS volumes) accessible by Linux on System z will appear in the Linux device tree. However, Solutions Enabler will not “discover” them, nor will it allow you to manage them by device name (such as, /dev/dasdf). In certain cases, you will be able to manage these devices by device number (for example, on the `symdg` command).

## SYMAPI home directory

The example procedures in this document assume that the Solutions Enabler <SYMAPI\_HOME> directory is located at:

- ◆ Windows: `c:\Program Files\EMC\SYMAPI...`
- ◆ UNIX: `/var/symapi/ ...`
- ◆ z/OS: `/var/symapi/ ...`

Pathnames presented in this document use a UNIX/specific format: forward slashes (/) instead of the backslashes (\) typically used on Windows platforms.

### IMPORTANT

By default, the location of <SYMAPI\_HOME> is the same for both z/OS and UNIX.

## Interoperability information

For information on previously released Solutions Enabler, VSS Provider, and SMI-S Provider features, refer to the corresponding release notes located on EMC Online Support at:

<https://support.EMC.com>

For detailed interoperability information, refer to E-Lab Interoperability Navigator at:

<http://elabnavigator.EMC.com>

## Solutions Enabler

### Support announcements

EMC lists the End of Service Life (EOSL) dates for the Solutions Enabler versions on EMC Online Support at <https://support.EMC.com>. On the EMC Online Support site, click **Support > Support By Product** in the main navigation bar. In the **Find a Product** box, type Solutions Enabler and click the arrow. The Solutions Enabler page will appear and the Service Life details are available on the left-hand side of the page.

### Solutions Enabler target revisions and adoption rates

EMC has established product target codes to ensure stable and reliable environments. As a best practice, it is recommended that you operate at the recommended target code or above to benefit from the latest enhancements and fixes.

To view the latest recommendations, search for **Solutions Enabler Target Revisions and Adoption Rates** on EMC support.

### Secure client/server root certificate replacement

The Solutions Enabler root certificate is used to generate and digitally sign subject certificates for use in SSL-secured client/server communications. The certificate is stored in the `symapisrv_trust.pem` file in the `<SYMAPI_HOME>/config/cert` directory. The file shipped with releases of Solutions Enabler prior to V7.4 expired in July, 2014.

An updated root certificate is included with Solutions Enabler V7.4 and higher with an expiration date of November, 2021.

Upon expiration of the older certificate, any client or server hosts which have not upgraded to Solutions Enabler V7.4 or higher will experience secure session negotiation failures. EMC recommends upgrading to V8.0.3 or higher as soon as possible to avoid outages due to the expiration of the older certificate.

For more information on certificate files, refer to the *VMAX Family Security Configuration Guide*.

## SMI-S Provider

### Supported profiles

[Table 1](#) shows the SMI-S Provider supported profile groupings and their namespaces.

**Table 1** Profile groupings with namespaces

Profile	Namespace
Array	root/emc
Server	interop

Table 2 lists the SMI-S profiles supported by the Array Provider of the SMI-S Provider.

**Table 2 SMI-S Provider profiles**

Profile	SMI-S V1.5	SMI-S V1.6
Access Points	X	X
Automated Storage Tiering <sup>1</sup>		X
Automated Storage Tiering Policy <sup>1</sup>		X
Block Server Performance	X	X
Block Services	X	X
Block Storage Views	X	X
Disk Drive Lite	X	X
Disk Sparing <sup>1</sup>	X	X
Extent Composition	X	X
Fan	X	X
FC Initiator Ports	X	X
FC Target Ports	X	X
FCoE Target Ports		X
Group Masking and Mapping <sup>2</sup>	X	X
Health	X	X
Indication	X	X
Indicator LED	X	X
iSCSI Target Ports	X	X
Job Control	X	X
Location	X	X
Multiple Computer System	X	X
Physical Package	X	X
Pools from Volumes <sup>2</sup>	X	X
Power Supply	X	X
Replication Services <sup>2</sup>	X	X
Software	X	X
Software Inventory		X
Storage Element Protection <sup>2</sup>	X	X
Storage Relocation <sup>2</sup>		X
Thin Provisioning <sup>2</sup>	X	X
Volume Composition <sup>1</sup>	X	X

1. Only supported for VMAX 10k/20k/40k arrays.
2. This profile is considered experimental and may change in future releases. As a result, backward compatibility cannot be guaranteed with the next release. Please contact EMC for permission to use this profile.

## Supported products and specifications

[Table 3](#) lists the SMI-S schemas and specifications supported by SMI-S Provider V8.0.3.

**Table 3** SMI-S Provider support for SMI-S

Supported schemas and specifications
Distributed Management Task Force Common Information Model (DMTF CIM) Schema V2.42.0
Storage Management Initiative Specification (SMI-S) V1.5.0, V1.6.0, V1.6.1
EMC ECOM V2.8.3.0.0.109 <sup>1</sup>

1. This is included as part of the SMI-S Provider installation.

## Rated metrics from VMAX3 arrays

SMI-S Provider V8.0 supports returning rated metrics from VMAX3 arrays. Rated metrics are obtained from a running instance of the Unisphere for VMAX application and provide the statistics in a calculated form per unit of time. The rates returned to SMI applications enable clients to consume the data directly without the need for any formulas or derivations.

# Environment and system requirements

## Solutions Enabler

Consider the following when working with Solutions Enabler V8.0.3.

### Host systems and Engenuity support

Solutions Enabler runs on a wide range of 64-bit operating systems and works with certain VMAX array versions. For detailed interoperability information, refer to E-Lab Interoperability Navigator at:

<http://elabnavigator.EMC.com>.

### Disk space requirements

Table 4 through Table 7 list the disk space requirements for supported platforms.

**Note:** A value of 0 KBs means the component is not supported on that platform.

**Table 4** Disk space requirements for AIX, Solaris Sparc UNIX

Install components (in KBs)	AIX	Solaris Sparc
Persistent data files	2853	852
SSL Certificate component	75	41
Thincore components	39158	11323
Base component (base storage, base mapping, and control storage libraries)	73681	38253
Command line tools (optional component)	91170	59379
Database mappings - SRM (optional component)	3390	659
SMI-S Provider (optional component)	0	0
Java Native Interface (optional component)	126576	52668
Symrecover including PERL 5.8 for Star (optional component)	19623	18541
Enable 64-bit component install	125290	38376

**Table 5** Disk space requirements for HP-UX ia64, and Linux ia64

Install components (in KBs)	HP-UX (ia64)	Linux (ia64)
Persistent data files	2853	992
SSL Certificate component	81	50
Thincore components	38649	24089
Base Component (Base Storage, Base Mapping, and Control Storage libraries)	79982	48195
Command line tools (optional component)	174732	98761
Database mappings - SRM (optional component)	934	820
SMI-S Provider (optional component) <sup>1</sup>	0	0
Java Native Interface (optional component)	0	0
Symrecover including PERL 5.8 for Star (optional component)	24189	20416
Enable 64-bit component install	0	0

1. SMI-S is listed strictly for sizing purposes and is installed with Solutions Enabler as part of the SMI-S Provider kit.

**Table 6** Disk space requirements for LinuxPPC, Linux on System z, and Celerral

Install components (in KBs)	Linux X64	Linux PPC	Linux on System z	Celerral
Persistent data files	978	984	977	979
SSL Certificate component	116	32	32	35
Thincore Components	13466	15804	13061	10783
Base component (Base Storage, Base Mapping, and Control Storage Libraries)	115087	29244	29637	32767
Command line tools (optional component)	56623	59256	56764	56144
Database mappings - SRM (optional component)	758	92	6	0
SMI-S Provider (optional component)	94226	0	0	0
Java Native Interface (optional component)	51764	0	0	0
Symrecover including PERL 5.8 for Star (optional component)	18134	17850	1617	0
Enable 64-bit component install	0	0	0	0

**Table 7** Disk space requirements for Windows

Install components (in MBs)	Windows (x64)
Base component (Base Storage, Base Mapping, and control storage libraries)	110
SSL Certificate component	1
Command line tools (optional component)	15
Database Mappings - SRM (optional component)	1
Java Native Interface (optional component)	39
Symrecover including PERL 5.8 for Star (optional component)	20

## Client/server interoperability

The server component of Solutions Enabler V8.0 SYMAPI is compatible with the client component of older SYMAPI versions from V7.4 and up. When planning to upgrade from V7.4 to V8.0.3, it is possible to do so in a staged fashion, upgrading the servers first, and then the clients. If access to V8.0.3 enhanced features is required only from the server systems, then there is no requirement to upgrade client systems. For clients to gain access to V8.0.3 enhanced features, they must be upgraded.

The client component of Solutions Enabler V8.0.3 SYMAPI is no longer compatible with older server components than V8.0.3.

Secured sessions using SSL are only available when both the client and server are running Solutions Enabler V7.4 or later on platforms that support secure communication.

Non-secured sessions between SSL-capable clients/servers and a remote peer on a non-SSL-capable platform are possible as long as you configure the security level of the SSL-capable clients/servers to ANY. For more information, refer to [“Client or server installation” on page 44](#) and the *EMC VMAX Family Security Configuration Guide*.

## Security settings

Refer to the *EMC VMAX Family Security Configuration Guide* for information on how security settings work in Solutions Enabler and how to configure them.

## VSS Provider

### Windows Server 2008 Hyper-V

VSS Provider V8.0 supports 64-bit Windows Server 2008 and 2008 R2 Hyper-V server virtualization for VMAX arrays. Hyper-V is installed and managed as a role under Windows Server 2008 and Windows Server 2008 R2.

VSS Provider supports the following guest operating systems with Windows server 2008 R2 (x64) as a parent operating system:

- ◆ Windows 2008 x64

- ◆ Windows 2008 R2 x64
- ◆ Windows Server 2012

## Windows Server 2012 Hyper-V

VSS Provider V8.0 supports 64-bit Windows Server 2012 and 2012 R2 Hyper-V server virtualization for VMAX arrays. Hyper-V is installed and managed as a role under Windows Server 2012 and 2012 R2.

VSS Provider supports the following guest operating systems with Windows server 2012 or Windows server 2012 R2 as a parent operating system:

- ◆ Windows 2008 R2 x64
- ◆ Windows 2012
- ◆ Windows 2012 R2

## Configuring the Hyper-V environment

For configuration instructions, refer to the *Hyper-V Getting Started Guide* and *Virtualization with Hyper-V: FAQ* located in the Microsoft TechNet Library.

By default, SCSI commands are filtered in Hyper-V in Windows Server 2008 R2 and Windows Server 2012. To use Solutions Enabler on a guest partition, disable the SCSI command filtering, as recommended in the *Planning for Disks and Storage* article in the Microsoft TechNet Library.

For Windows Server 2008 R2, the following PowerShell script, executed from the parent partition, disables SCSI command filtering for each guest partition listed as an argument to the script. The settings are persistent, but will require a restart of the partition to take effect. The script is provided as an example and does not include validation or error-checking:

```
$Target = $args[0]
$VSMManagementService = gwmi
MSVM_VirtualSystemManagementService -Namespace
"root\virtualization"
foreach ($Child in Get-WmiObject -Namespace
root\virtualization Msvm_ComputerSystem -Filter
"ElementName=' $Target' ")
{
$VMData = Get-WmiObject -Namespace
root\virtualization-Query "Associators of {$Child}
Where ResultClass=Msvm_VirtualSystemGlobalSettingData
AssocClass=Msvm_ElementSettingData"
$VMData.AllowFullSCSICommandSet=$true
$VSMManagementService.ModifyVirtualSystem($Child,$VMData.PSBase.GetText(1)) |
out-null}
```

For Windows Server 2008 R2, the following PowerShell script, executed from the parent partition, displays the current filtering status of each guest partition listed as arguments to the script. The script is provided as an example and does not include validation or error-checking:

```
$Target = $args[0]
foreach ($Child in Get-WmiObject -Namespace
root\virtualization
Msvm_ComputerSystem -Filter "ElementName='$Target'")
{
$VMData= Get-WmiObject -Namespace
root\virtualization-Query "Associators of {$Child}
Where ResultClass=Msvm_VirtualSystemGlobalSettingData
AssocClass=Msvm_ElementSettingData"
Write-host "VirtualMachine:" $VMData.ElementName
Write-Host "CurrentlyByPassingSCSIFiltering:"
$VMData.AllowFullSCSICommandSet}
```

For Windows Server 2012 R2, the following PowerShell script, executed from the parent partition, disables SCSI command filtering for each guest partition. The settings are persistent, but will require a restart of the partition to take effect. The script is provided as an example and does not include validation or error-checking:

```
$VSMManagementService = gwmi Msvm_VirtualSystemManagementService
-namespace "root\virtualization\v2"

function disablefiltering{
foreach ($Child in Get-WmiObject -Namespace root\virtualization\v2
Msvm_ComputerSystem -Filter "ElementName='$Target'"){
$VMData = Get-WmiObject -Namespace root\virtualization\v2 -Query
"Associators of {$Child}
Where ResultClass=Msvm_VirtualSystemSettingData"
$VMData.AllowFullSCSICommandSet=$true
$VSMManagementService.ModifySystemSettings($VMData.PSBase.GetText(1)) |
Out-Null
queryfiltering
}
If ($Child){ Break }
Else{ write-host -back Red "Could not find Virtual Machine $Target on
this Server" }
}

function enablefiltering{
foreach ($Child in Get-WmiObject -Namespace root\virtualization\v2
Msvm_ComputerSystem -Filter "ElementName='$Target'"){
$VMData = Get-WmiObject -Namespace root\virtualization\v2 -Query
"Associators of {$Child}
Where ResultClass=Msvm_VirtualSystemSettingData"
$VMData.AllowFullSCSICommandSet=$false
```

```

$VSMangementService.ModifySystemSettings($VMData.PSBase.GetText(1)) |
Out-Null
queryfiltering
}
If ($Child){ Break }
Else{ write-host -back Red "Could not find Virtual Machine $Target on
this Server" }
}

function queryfiltering{
foreach ($Child in Get-WmiObject -Namespace root\virtualization\v2
Msvm_ComputerSystem -Filter "ElementName='$Target'){
$VMData = Get-WmiObject -Namespace root\virtualization\v2 -Query
"Associators of {$Child}
    Where ResultClass=Msvm_VirtualSystemSettingData"
    Write-host -back darkgreen "Virtual Machine:" $VMData.ElementName
    Write-Host -back darkgreen "Currently ByPassing SCSI Filtering:"
$VMData.AllowFullSCSICommandSet
}
If ($Child){ Break }
Else{ write-host -back Red "Could not find Virtual Machine $Target on
this Server" }
}

$Target = Read-Host 'Enter Virtual Machine Name'
$Action = Read-Host 'Enter Filtering Action (Disable, Enable, Query)'

if ($Action -eq 'Disable'){ disablefiltering }
else
{
    if ($Action -eq 'Enable'){ enablefiltering }
    else
    {
        if ($Action -eq 'Query'){ queryfiltering }
        else { write-host -back Red 'Invalid Action Value: Value must be
"Disable", "Enable" or "Query."' }
    }
}
}

```

---

**Note:** For more information, refer to *EMC Symmetrix with Microsoft Hyper-V Virtualization* available at: <https://support.EMC.com>.

---

## Configuring child partition

To authorize Solutions Enabler access, use the SYMCLI `symcfg` command as shown in the following syntax example:

```
symcfg authorization add -host HostName -username
UserName -password PassWord -hyperv
```

Where:

- *HostName* — Hyper-V parent hostname/IP address
- *UserName* — Domain\username of parent Hyper-V server

**Note:** If the Hyper-V server is not under any domain, *HostName* should be appended for *Domain*, for example: *HostName\UserName*

- *PassWord* — Password of parent Hyper-V server

## VMAX gatekeeper requirements

At least three unique gatekeeper devices must be assigned to each Hyper-V child partition, as a pass-through disk, to allow Solutions Enabler access from the child partition to the VMAX array.

Based on the number of applications running on a child partition, more gatekeepers may be required. Refer to the appropriate release notes, or installation guide for gatekeeper recommendations for other applications.

**Note:** For specific gatekeeper sizing recommendations for all VMAX configurations, refer to EMC Knowledgebase article EMC 255976.

## Hyper-V connectivity support issues

Fibre Channel connectivity to the Hyper-V server is supported for VMAX arrays running HYPERVMAX OS 5977 and Engenuity 5876.

VSS Provider V8.0 does not support snapshot creation using iSCSI connectivity on virtual machines hosted on the Hyper-V server.

## Windows Server hotfix information

Ensure that all Microsoft Windows patches are up to date. The following Windows Server hotfix must be applied before installing and running VSS Provider.

For all Windows Server 2008 R2 editions listed in [Table 8 on page 36](#), Microsoft hotfix #KB975688 is required. The fix can be downloaded from the knowledge base article.

**Table 8** Microsoft Server 2008 R2 editions for hotfix

Windows editions
Windows Server 2008 Standard x64 Edition with SP1 or SP2
Windows Server 2008 Enterprise x64 Edition with SP1 or SP2
Windows Server 2008 R2 Standard x64 Edition with SP1
Windows Server 2008 R2 Enterprise x64 Edition with SP1

## Solutions Enabler compatibility

VSS Provider V8.0 requires that Solutions Enabler V8.0 is installed. VMAX arrays managed using VSS Provider must be running HYPERMAX OS 5977 or Enginuity 5876.

### Authorizing connectivity in Solutions Enabler

Components within your storage environment require authorization information to provide access for Solutions Enabler. The SYMCLI `symcfg authorization` command is used to supply this information.

## VMware virtual servers

VSS Provider supports all the platforms listed in [Table 8 on page 36](#) running as a virtual server on VMware ESX Server, for both Fibre Channel and iSCSI connectivity. The following versions of the VMware ESX Servers are supported:

- ◆ VMware ESX Server 4.0 (vSphere 4.0) (Update 1)
- ◆ VMware ESX Server 4.1 (Update 1)
- ◆ VMware ESXi server 4.1 (Update 1)
- ◆ VMware ESXi server 5.0 (Update 1)
- ◆ VMware ESXi server 5.1 (Update 1)
- ◆ VMware ESXi server 5.5

Refer to VMware vSphere and ESX documentation sets for detailed configuration instructions for ESX Server. You can find the most up-to-date VMware technical documentation on the VMware website.

### VMware configuration guidelines for ESX virtual server

To configure an ESX virtual server to properly run the VSS Provider, follow these configuration steps:

1. Install VMware tools on each virtual server where the VSS Provider is installed.
2. After creating your virtual machine, run the `vicfg.exe` utility to create an entry for the `symcfg` authorization database to configure communication with ESX Server.
3. For a virtual machine running on VMware ESX Server 4.0, configure the virtual machine with the fully qualified domain name (FQDN).

### VMware configuration guidelines for ESXi virtual server

To configure an ESXi virtual server to properly run the VSS Provider, follow these configuration steps:

1. Install VMware tools on each virtual sever where the VSS Provider is installed.
2. Use the SYMCLI `symcfg` command as shown in the following example:

```
symcfg authorization add -host HostName -username UserName
                        -password PassWord -namespace NameSpace -port Port -vmware
```

Where:

- *HostName* — ESXi server hostname/IP address
- *UserName* — username of ESXi server. Should be a root user.
- *PassWord* — password of ESXi server

- *Namespace* — namespace which qualifies the VMware web service address
- *Port* — port at which the VMware web service is listening

### Additional VMware virtual server support issues

Note the following support issues when running VSS Provider with VMware virtual servers:

- ◆ For VMAX arrays, the SPC-2 port flag must be set on all front-end ports to which the virtual server is connected.
- ◆ For VMAX arrays, the ACLX port flag must be enabled on the front-end directors.
- ◆ Fibre Channel connectivity to the ESX Server is supported. iSCSI connectivity is not supported for VMAX3 arrays running HYPERMAX OS 5977.
- ◆ For iSCSI support for VMAX 10K, 20K, 40K arrays running Enginuity 5876, the iSCSI initiator name on the ESX Server and virtual machine must be the same. Refer to your VMware documentation for enabling iSCSI on virtual machines.
- ◆ At least three unique gatekeeper devices must be assigned to each ESX/ESXi VM.

## SMI-S Provider

### VMAX gatekeeper requirements

When using the SMI-S Provider V8.0 to manage VMAX arrays, it is recommended that six gatekeepers be present for use by the provider.

### GNU Compiler Collection (GCC) standard C++ library requirements

SMI-S Provider V8.0 requires the GNU Compiler Collection (GCC) standard C++ library `/usr/lib/libstdc++.so.6` for its dynamically linked C++ binaries. This generally comes with `libstdc++ rpm`, which is found in systems with GCC version 3.4.0 and higher, or systems with `libstdc++` version 3.4.0 and higher.

Before installing SMI-S Provider V8.0 in RedHat Enterprise Linux and SuSE systems, verify that `compat-libstdc++ rpm` is already installed, which provides the compatible C++ libraries.

For example, run the following commands to check for these compatible C++ libraries:

```
# rpm -qa | grep libstdc++
compat-libstdc++-33-3.2.3-47.3
libstdc++-3.4.5-2
libstdc++-devel-3.4.5-2
compat-libstdc++-296-2.96-132.7.3
libstdc++-4.4.7.3.el6.x86_64
libstdc++-4.4.7.3.el6.i686
# rpm -ql libstdc++-3.4.5-2
/usr/lib/libstdc++.so.6
/usr/lib/libstdc++.so.6.0.3
```

```
# rpm -q1 libstdc++-4.4.7-3.el6.x86_64
```

```
/usr/lib64/libstdc++.so.6
```

```
/usr/lib64/libstdc++.so.6.0.13
```

```
# rpm -q1 libstdc++-4.4.7-3.el6.i686
```

```
/usr/lib/libstdc++.so.6
```

```
/usr/lib/libstdc++.so.6.0.13
```

If you do not have the correct version installed, obtain and install it before proceeding with the SMI-S Provider installation.

Run the following command to install the library:

```
# rpm -ivh compat-libstdc++*.rpm
```

## WBEM infrastructure

SMI-S Provider V8.0.3 utilizes an EMC-based WBEM (Web-Based Enterprise Management) infrastructure called EMC CIM Object Manager (ECOM). This WBEM infrastructure is used for both proxy and embedded environments across all EMC hardware and software platforms to ensure consistent implementation and experience across EMC products.

For detailed information about ECOM, see the *ECOM Deployment and Configuration Guide*.

## z/OS-specific requirements

The following are the z/OS-specific requirements.

---

**Note:** The following Solutions Enabler features are not supported on z/OS: RDF daemon, GNS, SRM, and Star. For more information, refer to [Table 24 on page 118](#).

---

## Platform requirements

EMC Solutions Enabler for z/OS runs on all IBM supported releases of z/OS, and it requires a pre-existing SMP/E environment.

Some of the z/OS components that Solutions Enabler for z/OS uses are:

- ◆ Language Environment services.
- ◆ UNIX System Services socket support.
- ◆ TCP/IP protocol stack.

---

**Note:** Only IBM TCP/IP has been qualified by EMC. Support for other TCP/IP protocol stacks must be requested through the EMC Request for Price Quotation (RPQ) process.

---

There are no special requirements to enable IBM TCP/IP support.

## z/OS-specific directory structure requirements

With the introduction of SSL-protected client/server sessions, the installation process looks for the installer's instructions about where to place the SYMAPI base directory. The base directory specifies a high-level location where the standard SYMAPI directory will reside. Since use of SSL was optional, the Unix System Services directories were not required to be created.

The SYMAPI directory structure is required on any host running Solutions Enabler V7.4 or higher. Configuration files must reside in the `config` directory under the base directory, and log files will be stored in the `log` directory.

## Unix System Services file system requirements

The following are z/OS Unix System Services file system requirements:

### Logging

The server, base, and event daemon write data to log files in the Unix System Services file system. Summary log data is written to `SYS$PRINT DD`, but the comprehensive detail is written to Unix System Services files.

### SYMAPI log file

Solutions Enabler writes all SYMAPI log data to a standard dated log file in the SYMAPI log directory.

## Unix System Services file system options

The following Unix System Services file system options can be configured to meet your environment:

### SYMAPI database

MVS datasets (via DD `SYM$DB`) are not supported. The Unix System Services file system will always be used to store the database.

### Avoid, Gatekeeper Avoid and Select, and INQ files

Starting with release V7.6, Solutions Enabler does not read select or avoid files using JCL definitions. In other words, relevant DD statements (`SYM$AVD`, `SYM$GAVD`, `SYM$GSEL`, and/or `SYM$INQ`) are no longer supported in JCL. If they are present, `SymInit` received would fail with an error message `SYMAPI_C_FILE_TYPE_NOT_SUPPORTED`.

DD statements such as `SYM$ENV` and `SCR$xxxx` are still valid.

For more information on the avoidance and selection files, refer to [“Avoidance and selection files” on page 175](#).

## Running z/OS as a guest

When running z/OS as a guest under the z/VM operating system, the TimeFinder and SRDF utilities require special consideration. Devices must be defined to z/VM (`SET RDEV`) as:

```
TYpe UNSUPported DEVCLass DASD DPS Yes RESERVE_RELEASE Yes
These devices must be attached to the z/OS guest.
```

---

**Note:** VM does not allow volumes defined as unsupported to be attached to `SYSTEM`, or used to IPL a virtual machine.

---

## Virtual memory requirements

Solutions Enabler software always uses allocated memory above the 16 MB line. The actual region required depends on many factors such as the number of active tasks and connections, the number of managed VMAX arrays, and devices. It is not unusual for Solutions Enabler tasks (especially the server and base daemons) to consume many hundreds of megabytes of memory. If this is a possibility, consult with your system programmer to ensure that paging environments are adjusted accordingly.

EMC recommends specifying `REGION=0M` on the JOB card or EXEC card for the following jobs:

- ◆ `#10ECCIN`
- ◆ `#STORSRV` and any other JCL which uses `#STORSRV` as a model
- ◆ `#STORAPI` and any other JCL which uses `#STORAPI` as a model
- ◆ `#STOREVT` and any other JCL which uses `#STOREVT` as a model
- ◆ `#STORGNS` and any other JCL which uses `#STORGNS` as a model

These members are distributed with `REGION=0M` already specified on the EXEC cards. Your site may have SMF or JES exits or security rules established which restrict the use of `REGION=0M`. Check with your system programmer to verify that the submitting user has the authority to use `REGION=0M`.

## Backward/forward compatibility for applications

Solutions Enabler V8.0 can only read databases previously written by Solutions Enabler V7.4 or higher. Database files earlier than V7.4 must be rebuilt. For details on rebuilding the SYMAPI and Base Daemon databases, see Knowledgebase article 000009813.

In client/server mode, Solutions Enabler V8.0 servers only support clients running Solutions Enabler V7.4 or higher.

---

**Note:** SYMAPI database access is not forward compatible because a SYMAPI library cannot access a database created by a newer version of a SYMAPI application. If, for example, the version of the local library becomes out of sync with the version of the local SYMAPI database (as a V7.4 SYMAPI library call from a SYMAPI client attempting to access a V8.0 database) it will return error: `SYMAPI_C_DB_FILE_TOO_NEW`.

This restriction relates only to local databases. In client/server environments, accesses to a server database of a later version are automatically resolved by the SYMAPI, which performs all necessary translation of information between the client and the server.

---

## Storage systems

This section identifies storage system array models, operating software versions, and configuration requirements for the supported VMAX arrays.

### VNX or CLARiiON arrays

Solutions Enabler V8.0 no longer supports VNX and CLARiiON arrays.

### SMI-S Provider array support

SMI-S Provider V8.0 supports the following VMAX storage families:

- VMAX3 Family (VMAX 100K, 200K and 400K)
- Read-only support for the VMAX Family (VMAX 10K, 20K and 40K)

### VSS Provider array support

VSS Provider supports VMAX Family arrays with Enginuity 5876 and VMAX3 Family arrays with HYPERMAX OS 5977.

#### Supported HYPERMAX OS

VMAX arrays managed using VSS Provider must be running Enginuity 5876 or HYPERMAX OS 5977.

#### Connectivity

For HYPERMAX OS 5977, VMAX3 arrays support Fibre Channel connectivity only. For Enginuity 5876, VMAX arrays support both Fibre Channel and iSCSI connectivity.

#### VMAX array configuration requirements

Configuration requirements for using VSS Provider with VMAX arrays are as follows:

##### ◆ Director flags

When using the VSS Provider with storage arrays, the following director flags must be enabled on all directors connecting to the VSS host:

- VCM director flag (VCM\_state) — Enables the Volume Logix software on the VMAX array so that the VSS Provider can perform device masking. If this flag is not enabled, then the VSS Provider fails to create and import snapshots, due to the lack of device masking capabilities.
- SPC-2 (SPC2\_Protocol\_Version) director flag— Forces the VMAX array to report its device identifiers in a way that VSS recognizes. If this flag is not enabled, then the VSS service fails all snapshots before the VSS Provider is even called.
- ACLX director flag — Must be enabled on the directors of VMAX arrays. This director flag enables the Auto-provisioning Groups software on the array so that the VSS Provider can perform device masking. If this flag is not enabled, then the VSS Provider fails to create and import snapshots, due to the lack of device masking capabilities.

##### ◆ VMAX array masking view

At least one masking view must be present before proceeding with any VSS Provider operations.

- ◆ TimeFinder Mirror
 

VSS Provider requires a BCV to be paired with the source LUN. This requires performing a full Establish operation at some point. Multiple BCVs are supported for a given source LUN. Currently synchronized BCVs are used first, followed by the oldest split BCV (longest time since last split).

TimeFinder Mirror is not supported when `EnforceDefaultToClone` is set to `True` in the registry.

VSS Provider supports both Thin BCV (TDEV+BCV) and thick BCV device configurations on VMAX 10K, 20K, and 40K arrays running Enginuity 5876.
- ◆ TimeFinder Clone
 

TimeFinder Clone is supported only through EMC Requestors, which require the VSS requestor to handle all configuration requirements when `EnforceDefaultToClone` is set to `False` in the registry. VSS expects the target clone to be in the Created or Recreated state when `RetainCloneSession` is set to `False` in the registry.
- ◆ TimeFinder VP Snap
 

VSS Provider supports TimeFinder VP Snap only when the registry key `EnforceVPSnap` is set to `True`. With differential snapshots, VSS Provider looks first for a valid VP Snap replica. If a VP Snap session does not exist, the provider exits with a valid error message.
- ◆ Remote (SRDF®) TimeFinder Mirror (Remote BCV)
 

VSS Provider supports an R1 to R2 - Remote BCV configuration. The SRDF link must be synchronous and in the Synchronized state. Beyond this point, the rules of local TimeFinder Mirror take over.

VSS does not provide a way to differentiate between local and remote snapshots. However, VSS Provider coordinates the two, and gives preference to local snapshots before remote snapshots. This means that if both local and remote BCVs are configured, the local BCV will be used in the snapshot. To force VSS Provider to use Remote BCVs, set the registry key “[RemoteSnapshotsOnly](#)” outlined in [Table 41 on page 193](#).

Remote (SRDF) TimeFinder Mirror is not supported when `EnforceDefaultToClone` is set to `True` in the registry.
- ◆ Remote (SRDF) TimeFinder Clone (RClone, TDEV)
 

Remote TimeFinder Clone is supported only through EMC requestors, which require the VSS requestor to handle all configuration requirements when `EnforceDefaultToClone` is set to `False` in the registry.
- ◆ Remote (SRDF) TimeFinder VP Snap
 

Remote TimeFinder VP Snap is supported only when the registry key `EnforceVPSnap` is set to `True`.

---

**Note:** All of the above described VSS-supported TimeFinder Mirror and TimeFinder Clone operations support only Thin devices (TDEVs and TDEV-BCVs).

---

## Supported replication technologies

Table 9 lists the EMC replication technologies that are supported with VSS Provider.

**Table 9** VSS Provider supported replication technologies

Array	Plex snapshot	Differential snapshot
VMAX arrays running Engenuity 5876	TimeFinder Mirror TimeFinder Clone Remote (over SRDF) TimeFinder Mirror Remote (over SRDF) TimeFinder Clone	TimeFinder VP Snap TimeFinder Snap Remote (over SRDF) TimeFinder VP Snap Remote (over SRDF) TimeFinder Snap
VMAX3 arrays running HYPERMAX OS 5977	SnapVX plex TimeFinder/Mirror <sup>a</sup> TimeFinder/Clone <sup>b c</sup> Remote (over SRDF) SnapVX plex Remote (over SRDF) TimeFinder/Mirror <sup>a</sup> Remote (over SRDF) TimeFinder/Clone <sup>b c</sup>	SnapVX differential Remote (over SRDF) SnapVX differential <sup>b</sup> TimeFinder VP Snap <sup>d</sup> Remote (over SRDF) TimeFinder VP Snap <sup>d</sup>

a. Not supported when registry key EnforceDefaultToClone is set to TRUE.

b. Requires the use of EMC requestors NMM, RM, TFIM.

c. Does not require the use of EMC Requestors NMM, RM, TFIM when registry key EnforceDefaultToClone is set to TRUE.

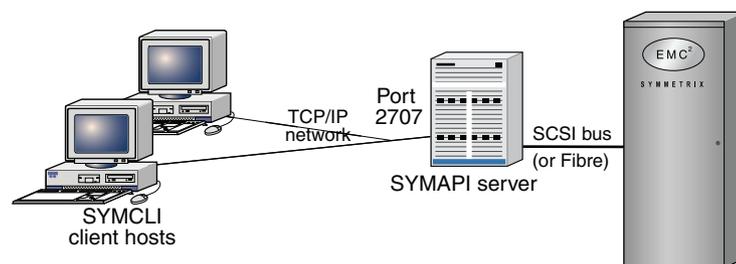

d. Supported only when registry key EnforceVPSnap is set to True.

## Client or server installation

If your computer is locally connected to a VMAX array, go to [Chapter 2](#). If your computer is a client or the SYMAPI server, read the following sections.

### Remote connection

You can run SYMCLI as a client to a remote SYMAPI server to manage a remotely-controlled VMAX array. The following diagram shows a VMAX array in the client/server system.

**Figure 1** A VMAX array in the client/server system

### Client/server IP communication

The SYMAPI client and server are both capable of negotiating sessions over the traditional Internet Protocol Version 4 (IPv4) and the newer Internet Protocol Version 6 (IPv6).

All hosts that use TCP/IP for communications use at least IPv4, a protocol well known to many applications. Newer versions of host operating systems will also support configuration of IPv6 local addresses, routing, and Domain Name Services as well. For the foreseeable future, many networks are likely to be running with dual protocol stacks

activated, where communications will take place over IPv4 most of the time. Applications such as Solutions Enabler can also detect the presence of IPv6 configuration and use it whenever possible.

In UNIX, Linux, and Microsoft Windows Server environments, the SYMAPI server and client will interoperate with both IPv6 and IPv4 protocols on hosts that are configured to run both. The protocol selected by the server and the client depends on the exact configuration of the host, router, and DNS servers in your network, and on the settings in the Solutions Enabler network services configuration file.

## Client/server security

Solutions Enabler uses Secure Socket Layer (SSL) protocol to enable secure communication in a client/server system. Using open source SSL (OpenSSL) technology, the client and server communicate over an authenticated, encrypted connection.

When a client attempts to connect to a server, the two machines exchange a handshake in which they both identify their security expectations and capabilities. If their security capabilities are the same, the two will negotiate the appropriate type of session (secure or non-secure). If their security capabilities are different, either the client or the server will reject the session.

The SYMAPI client and server are initially configured to communicate via secure sessions. You must modify this behavior if a platform in the environment does not support secure communications. The *EMC VMAX Family Security Configuration Guide* provides instructions on modifying this default behavior.

[Table 10](#) lists the host operating systems that support SSL.

**Table 10** Host operating system support for SSL

Supported operating system
AIX (64-bit)
HP-UX (64-bit) HP-UX Itanium (64-bit)
Linux Itanium (64-bit) Linux AMD (64-bit)
Solaris (64-bit)
Windows AMD (64-bit)
z/OS

## Client/server system installation

The following information outlines procedures for installing Solutions Enabler in a client/server system:

1. Install Solutions Enabler software in the machine designated as the client, according to the procedures in [Chapter 2](#).
2. Install the same Solutions Enabler software in the machine designated as the server, according to the procedures in [Chapter 2](#).

3. Edit the `netcnfg` file in the client machine to include the host name or IP address of the server. [“SYMCLI through a remote server” on page 156](#) provides instructions.
4. Issue a `stordaeomon start storsrvd` command on the server machine. [“SYMCLI through a remote server” on page 156](#) provides instructions.
5. Set environment variables `SYMCLI_CONNECT` and `SYMCLI_CONNECT_TYPE` on the client. [“SYMCLI through a remote server” on page 156](#) provides instructions.

## Installation checklist

This section provides operating system-specific checklists with high-level installation and configuration steps that advanced Windows and UNIX users may find useful:

- ◆ [“Windows installation check list” on page 47](#)
- ◆ [“UNIX installation check list” on page 48](#)

## Windows installation check list

**Table 11** Windows installation check list

Task	More Information	Done
<b>Pre-Installation</b>		
Ready the environment for Solutions Enabler.	For instructions and requirements, refer to <a href="#">“Before you begin” on page 22</a> and <a href="#">“Environment and system requirements” on page 30</a> , respectively.	<input type="checkbox"/>
<b>Installation</b>		
1. Download the installation package	N/A	<input type="checkbox"/>
2. Start the installation wizard by running the following: <code>se8030-Windows-x64.exe</code>	For information on running the installation from the command line, refer to <a href="#">“Using the command line” on page 65</a> . If you select the custom installation option, <a href="#">Table 16 on page 64</a> describes the available options.	<input type="checkbox"/>
<b>Post installation</b>		
1. Enable the Solutions Enabler features with the following command: <code>symlmf add</code>	For more information, refer to <a href="#">“Licensing your software” on page 86</a> .	<input type="checkbox"/>
2. Build the SYMAPI database by entering the following command: <code>symcfg discover</code>	For more information, refer to <a href="#">“Building the SYMAPI database” on page 110</a> .	<input type="checkbox"/>
3. Set the environment variables so you can directly access the SYMCLI commands by ensuring that the following SYMCLI directory is appended to the MS-DOS variable PATH: <code>C:\Program Files\EMC\SYMCLI\bin</code>	For more information, refer to <a href="#">“Setting environment variables” on page 111</a> .	<input type="checkbox"/>
4. <i>Optional:</i> Read the <i>EMC VMAX Family Security Configuration Guide</i> and apply related security settings.	For more information, refer to <i>EMC VMAX Family Security Configuration Guide</i> .	<input type="checkbox"/>
5. <i>Optional:</i> Modify the scope/performance of the SYMCLI commands with the <code>gkavoid</code> , <code>gkselect</code> , <code>inqfile</code> , <code>symavoid</code> files.	For more information, refer to <a href="#">“Avoidance and selection files” on page 114</a> .	<input type="checkbox"/>
6. <i>Optional:</i> Create an options file to modify the default behavior of Solutions Enabler. This file is initially installed as <code>README.options</code> in the SYMAPI configuration directory.	For more information, refer to <a href="#">“Changing the default behavior of SYMCLI” on page 115</a> .	<input type="checkbox"/>
7. <i>Optional:</i> Configure the necessary daemons for the environment.	For instructions, refer to: <ul style="list-style-type: none"> <li>• <a href="#">“Setting up daemons for distributed application support” on page 117</a></li> <li>• <a href="#">“Managing the base daemon” on page 122</a></li> <li>• <a href="#">“Setting up the event daemon for monitoring” on page 124</a></li> </ul>	<input type="checkbox"/>

## UNIX installation check list

**Table 12** UNIX installation check list

Task	More Information	Done
<b>Pre-Installation</b>		
Ready the environment for Solutions Enabler.	For instructions and requirements, refer to <a href="#">“Before you begin” on page 22</a> and <a href="#">“Environment and system requirements” on page 30</a> , respectively.	<input type="checkbox"/>
<b>Installation</b>		
1. Download the installation package	For operating system-specific commands, refer to <a href="#">“Step 1: Download the installation package” on page 52</a> .	<input type="checkbox"/>
2. Run the installation script. For example, to run the full interactive script, enter the following command:  <code>./se8030_install.sh -install</code>	For information on running alternative installation methods, such as silent, incremental, or response file, refer to <a href="#">“Step 2: Run the install script” on page 52</a> .	<input type="checkbox"/>
3. Verify the installation by entering the following command:  <code>./se8030_install.sh -check</code>	For more information, refer to <a href="#">“Verifying your installation” on page 60</a> .	<input type="checkbox"/>
4. <i>Optional:</i> Remove the temporary file:  <code>/tmp/emc_app_data_path</code>	For more information, refer to <a href="#">“Removing temporary file” on page 60</a> .	<input type="checkbox"/>
5. In a Linux on System z installation on Novell SLES 10, install the Linux I/O module for CKD devices.  For example, to load the kernel object in a SLES 10 Service Pack 1 environment, enter:  <code>cd /usr/symapi/ioctl/ cd suse10sp1 insmod s390ioctl.ko</code>	For more information, refer to <a href="#">“Installing the Linux I/O module for CKD devices” on page 60</a> .	<input type="checkbox"/>
<b>Post installation</b>		
1. Enable the Solutions Enabler features with the following command:  <code>symmf add</code>	For more information, refer to <a href="#">“Licensing your software” on page 86</a> .	<input type="checkbox"/>
2. Build the SYMAPI database by entering the following command:  <code>symcfg discover</code>	For more information, refer to <a href="#">“Building the SYMAPI database” on page 110</a> .	<input type="checkbox"/>
3. For Linux Kernel 2.4, compile the SCSI generic driver into the kernel or compile it as a loadable kernel module.	For instructions, refer to the README file in the top-level directory of the Linux source package.	<input type="checkbox"/>

**Table 12** UNIX installation check list

Task	More Information	Done
<p>4. Set the environment variables so you can directly access the SYMCLI commands:</p> <p>For UNIX C shell, ensure the following SYMCLI directory is appended to variable PATH:</p> <pre>set path = (\$path /usr/symcli/bin)</pre> <p>For UNIX Korn and Bourne shell, ensure the following SYMCLI directory is appended to variable PATH:</p> <pre>PATH=\$PATH:/usr/symcli/bin export PATH</pre>	For more information, refer to <a href="#">“Setting environment variables”</a> on page 111.	<input type="checkbox"/>
<p>5. Set the environment variable so you can directly access the online help (man pages):</p> <p>For UNIX C shell, ensure the following man page directories are added to variable MANPATH:</p> <pre>set MANPATH = (\$MANPATH   /usr/storapi/man   /usr/storapi/storman)</pre> <p>For UNIX Korn and Bourne shell, ensure the following man page directories are added to variable MANPATH:</p> <pre>MANPATH=\$MANPATH:/usr/storapi/man: /usr/storapi/storman export MANPATH</pre>	For more information, refer to <a href="#">“Setting environment variables”</a> on page 111.	<input type="checkbox"/>
<p>6. Configure an adequate number of semaphores into the UNIX kernel to meet the SYMCLI semaphore requirements.</p>	For more information, refer to <a href="#">“Managing database and gatekeeper locking”</a> on page 113.	<input type="checkbox"/>
<p>7. <i>Optional:</i> Read the <i>EMC VMAX Family Security Configuration Guide</i> and apply related security settings.</p>	For more information, refer to <i>EMC VMAX Family Security Configuration Guide</i> .	<input type="checkbox"/>
<p>8. <i>Optional:</i> Modify the scope/performance of the SYMCLI commands with the <code>gkavoid</code>, <code>gkselect</code>, <code>inqfile</code>, <code>symavoid</code> files.</p>	For more information, refer to <a href="#">“Avoidance and selection files”</a> on page 114.	<input type="checkbox"/>
<p>9. <i>Optional:</i> Create an options file to modify the default behavior of Solutions Enabler. This file is initially installed as <code>README.options</code> in the SYMAPI configuration directory.</p>	For more information, refer to <a href="#">“Changing the default behavior of SYMCLI”</a> on page 115.	<input type="checkbox"/>
<p>10. <i>Optional:</i> Configure the necessary daemons for the environment.</p>	For instructions, refer to: <ul style="list-style-type: none"> <li>• <a href="#">“Setting up daemons for distributed application support”</a> on page 117</li> <li>• <a href="#">“Managing the base daemon”</a> on page 122</li> <li>• <a href="#">“Setting up the event daemon for monitoring”</a> on page 124</li> </ul>	<input type="checkbox"/>

# CHAPTER 2

## Installation

This chapter explains how to install/upgrade Solutions Enabler and its components:

- ◆ [Installing Solutions Enabler on UNIX and Linux](#)..... 52
- ◆ [Installing Solutions Enabler on Windows](#)..... 61
- ◆ [Installing Solutions Enabler on z/OS](#) ..... 69
- ◆ [Installing Solutions Enabler on OpenVMS](#)..... 80

---

**Note:** As an alternative to the in-depth UNIX and Windows procedures in this chapter, [“Installation checklist” on page 46](#) provides operating-system-specific checklists with high-level installation and configuration steps that advanced users may find useful.

---

## Installing Solutions Enabler on UNIX and Linux

This section describes how to install/upgrade Solutions Enabler on UNIX and Linux hosts.

Please consider the following before starting the installation procedure:

- ◆ Solutions Enabler V8.0.3 is fully upgradeable, that is, you do not have to remove the previous version before installing V8.0.3.
- ◆ Before starting this procedure, be sure to review pre-install considerations in [Chapter 1](#).
- ◆ The default responses to the prompts in this section are in brackets [ ].

### Step 1: Download the installation package

To download the installation package:

1. Log onto the host system as **root**.
2. Open a browser and visit the EMC online support website at <https://support.EMC.com>.
3. Download the installation package for your platform and extract the content to a temporary directory.

---

**Note:** To download the software for Solutions Enabler V8.0.3, please contact your EMC representative.

---

### Step 2: Run the install script

To run the installation script:

1. Change directory to the location of the Solutions Enabler kit by entering the following:

```
cd /tmp_directory
```

2. Select an installation method from [Table 14](#), and then run the appropriate command. For descriptions of the command options, refer to [Table 15 on page 55](#).

**Table 14** Installation method (page 1 of 2)

Method	Command	Comments
Interactive	<code>./se8030_install.sh -install</code>	Starts the interactive script documented in the remainder of this chapter. When using this method, continue with <a href="#">“Step 3: Select the installation directories” on page 56</a> .
Silent (all components)	<code>./se8030_install.sh -install -silent [-all]</code>	Silently installs the default Solutions Enabler components, or all Solutions Enabler components when the <code>-all</code> option is specified. When using this method, continue with <a href="#">“Step 5: Complete the installation” on page 59</a> .
	<code>./se8030_install.sh -install -silent -nocert [-all]</code>	Silently installs the default Solutions Enabler components, or all Solutions Enabler components when the <code>-all</code> option is specified, but without the default SSL certificate files. When using this method, continue with <a href="#">“Step 5: Complete the installation” on page 59</a> .
Silent (specific components)	<code>./se8030_install.sh -install -silent [-nocert] [-jni] [-srm] [-all] [-symrec] [-smis] [-lockboxpassword] [-force] [-daemonuid] [-permission] [-homedir] [-datadir] [-nodeps] [-copy_lic] [-tc] [-nocert]</code>	Silently installs only the specified components. When using this method, continue with <a href="#">“Step 5: Complete the installation” on page 59</a> .

**Table 14** Installation method (page 2 of 2)

Method	Command	Comments
Incremental (specific components)	<pre>./se8030_install.sh -increment [-cert][-jni] [-srm] [-symrec]</pre>	<p>Incrementally adds the specified component to an existing installation. When using this method, continue with <a href="#">“Step 5: Complete the installation” on page 59</a>.</p> <p>To use this method, you must have already installed the DATA, THINCORE, BASE, and SYMCLI components.</p> <hr/> <p><b>Note:</b> This method is not supported on Solaris.</p>
Response file	<pre>./se8030_install.sh -file Response_File_Name</pre>	<p>Runs the installation script according to the contents of your response file. To use this method, create a response file containing the relevant command line options (refer to the examples on the next page), and then run the command, specifying the name of your text file. Response file entries can be separated by a space or on separate lines and options must not have leading hyphens.</p> <p>Using this method, you can specify the argument INCREMENT to perform an incremental installation or SILENT to perform a silent installation.</p> <p>For example, to incrementally install the SYMRECOVER component:</p> <ol style="list-style-type: none"> <li>1. Create the following response file: <pre># cat responsefile.txt increment symrec #</pre> </li> <li>2. Run the command: <pre>./se8030_install.sh -file responsefile.txt</pre> </li> </ol> <p>For example, to silently install Solutions Enabler with the Java Interface and SRM components:</p> <ol style="list-style-type: none"> <li>1. Create the following response file: <pre># cat responsefile.txt install silent jni srm #</pre> </li> <li>2. Run the command: <pre>./se8030_install.sh -file responsefile.txt</pre> </li> </ol> <p>When using this method, continue with <a href="#">“Step 5: Complete the installation” on page 59</a>.</p>

Table 15 defines the various options used when running the installation commands detailed in Table 14 on page 53.

**Table 15** UNIX installation options

Option	Description
-all	Installs all of the optional Solutions Enabler components, including the Java Interface; the Oracle, UDB, and Sybase daemons; and the SYMRECOVER component. Used with the <code>-silent</code> option.
-cert	Install SSL certificate files.
-copy_lic=directory	Copies the user-supplied <code>symapi_licenses.dat</code> file to <code>/var/symapi/config</code> during installation. Used with the <code>-silent</code> option. For example, the following command will copy the <code>symapi_licenses.dat</code> file from <code>/tmp</code> to <code>/var/symapi/config</code> : <pre>bash-3.00# ./se8030_install.sh -install -copy_lic=/tmp -silent</pre>
-daemonuid=Name	Changes ownership of some daemons to non root user. Used with the <code>-silent</code> option. For information on which daemons are affected by this option, refer to the <code>stordaeomon</code> man page in the <i>EMC Solutions Enabler SYMCLI Command Reference Guide</i> .
-datadir=directory	Sets the working root directory [ <code>/usr/emc</code> ]. Used with the <code>-silent</code> option.
-decrement	Uninstall of <code>cert</code> , <code>jni</code> , <code>srm</code> , <code>smis</code> (Linux only), <code>symrec</code> . This option is not valid for Solaris hosts
-file	Specifies to install Solutions Enabler with a response file.
-force	Kills all processes using the SYMAPI libraries. Used with the <code>-silent</code> option.
-homedir=directory	Sets the install root directory [ <code>/opt/emc</code> ]. Used with the <code>-silent</code> option.
-increment	Incremental installation of the <code>cert</code> , <code>jni</code> , <code>srm</code> , <code>smis</code> (Linux only), and <code>symrec</code> options. This option is not valid for Solaris hosts!
-jni	Installs the Solutions Enabler Java Interface component.
-nocert	Do not install SSL certificate files.
-permission=level	Sets permission on <code>/var/symapi</code> directory. Used with the <code>-silent</code> option.
-silent	Specifies to perform a silent installation.
-smis	Installs the SMISPROVIDER component.
-srm	Installs all of the optional database components, including the Oracle, UDB, and Sybase daemons.
-symrec	Installs the SYMRECOVER component.
-tc	Installs THINCORE components (data and thin core).
-lockboxpassword=password	Sets the password for the lockbox. The password must be at least eight characters long, containing at least one uppercase letter, one lowercase letter, one number, and one special character. Allowed special characters are <code>!@#%&amp;</code> . Used with the <code>-silent</code> option. For detailed information about the lockbox, please refer to the <i>EMC VMAX Family Security Configuration Guide</i> .

**Note:** For help running the installation script, run the following:

```
./se8030_install.sh -help
```

---

**Note:** The installation script creates log files in the directory `/opt/emc/logs`. For more information, refer to [Appendix F](#).

---

## Step 3: Select the installation directories

To select the installation directories, do one of the following:

- ◆ If you are installing Solutions Enabler on a host for the first time, complete “[Step 3A: Installing for the first time](#)” on page 56.
- ◆ If you are upgrading or reinstalling Solutions Enabler, complete “[Step 3B: Upgrading /reinstalling](#)” on page 57.

---

**Note:** It is recommended that you install Solutions Enabler on your host’s internal disks and not on a network device.

---

### Step 3A: Installing for the first time

If you are installing Solutions Enabler on a Linux host for the first time, the following prompt displays:

```
Do you want to import public key for verifying Digital Signatures ?
[Y]:
```

- A [**Y**]es response imports the public key for verifying Digital Signatures.
- A [**N**]o response does not import the public key.

If you are installing Solutions Enabler on a host for the first time, the following prompt displays:

```
Install Root Directory [/opt/emc]:
```

1. Press **Enter** to accept the default installation directory `/opt/emc`, or enter another root directory.

If you enter a root directory (absolute directory) other than the default, you will be prompted to confirm the directory.

2. At the following prompt, press **Enter** to accept the default working directory `/usr/emc`, or enter another working directory. This directory is where the data and log files will be written:

```
Working root directory [/usr/emc]:
```

If you enter a working directory (absolute path) other than the default, you will be prompted to confirm the directory.

3. At the following prompt, specify whether to run the SYMAPI Server daemon, event daemon, Group Name Services daemon, and Watchdog daemon without root privileges. A [**Y**]es response will enable you to specify a non-root user to run the daemons:

```
Following daemons can be set to run as a non-root user:
storevntd, storgnsd, storrdfd, storsrvd, storstpd, storwatchd
Do you want to run these daemons as a non-root user? [N]:
```

- Continue with [“Step 4: Select installation options” on page 57.](#)

## Step 3B: Upgrading /reinstalling

If you are upgrading or reinstalling Solutions Enabler, the following prompt displays:

```
Install root directory of previous installation: /opt/emc
Do you want to change Install root Directory ? [N]:
```

- Respond **[N]** to install Solutions Enabler into the same root directories (install and working) as the previous installation, or respond **[Y]**es to display the following prompts in which you can enter other root directories:

```
Install root directory [/opt/emc]:
Working root directory [/usr/emc]:
```

If you enter a root directory (absolute directory) other than the default, you will be prompted to confirm the directory.

- If you are upgrading, the following prompt displays asking whether to backup the previous installation. A **[Y]**es response backs up the SYMCLI binaries in the install root directory under `symcli_old`:

```
Do you want to save /opt/emc/SYMCLI/ ? [N]:
```

- At the following prompt, specify whether to run the SYMAPI Server daemon, event daemon, Group Name Services daemon, and Watchdog daemon without root privileges. A **[Y]**es response will enable you to specify a non-root user to run the daemons:

```
Following daemons can be set to run as a non-root user:
storevntd, storgnsd, storrdfd, storsrvd, storstpd, storwatchd
Do you want to run these daemons as a non-root user? [N]:
```

- If the installation program detects that there are daemons currently running, the following prompt displays asking whether to shut them down or exit the installation. A **[Y]**es response shuts down the daemons. A **[X]** response exits the installation:

```
Do you want to shutdown SYMCLI daemons [Y] or Exit setup [X]? [Y]:
```

- Continue with [“Step 4: Select installation options” on page 57.](#)

## Step 4: Select installation options

To select your installation options:

- At the following prompt, specify whether to install Solution Enabler SSL certificate files:

```
Install EMC Solutions Enabler Certificates for secure Client/Server
operation? [Y]:
```

- A **[Y]**es response installs `ssl.rnd`, `symapisrv_install.cnf`, `symapisrv_trust.pem`, `symapisrv_trust_v8.0.pem` in `/var/symapi/config/cert`. The subject certificate and key files `symapisrv_cert.pem`, `symapisrv_key.pem`, `symapisrv_cert_v8.0.pem`, `symapisrv_key_v8.0.pem` will also be generated.
- A **[N]**o response doesn't install CERT component.

**IMPORTANT**

If you do not install SSL certificate files at this time but intent to use secure client/server communication with Solutions Enabler, you must install your own certificate files after the installation is completed. For detailed information on how to do that, please refer to the *EMC VMAX Family Security Configuration Guide*.

- At the following prompt, specify whether to install *all* of the Solutions Enabler libraries:

```
Install All EMC Solutions Enabler Shared Libraries and Run Time Environment? [Y]:
```

- A [**Y**]es response installs *all* the libraries, including persistent data, Thin Core, and Base (which includes the StorBase, StorCtrl, and StorMap library components).
- A [**N**]o response installs only persistent data and Thin Core.

- At the following prompt, specify whether to install the collection of binaries known as SYMCLI. A [**Y**]es response installs the SYMCLI binaries:

```
Install Symmetrix Command Line Interface SYMCLI ? [Y]:
```

- At the following prompt, specify whether to install the Solutions Enabler Java interface component. You should install this component if your Solutions Enabler application uses a Java interface. A [**Y**]es response installs the JNI component:

```
Install Option to Enable JNI Interface for EMC Solutions Enabler APIs ? [N]:
```

- If you are installing Solutions Enabler on a host with a Linux, HP-UX, SunOS, or AIX operating system, the following prompt displays, asking whether to install *optional* database components:

```
Install EMC Solutions Enabler SRM Components ? [N]
```

A [**Y**]es response installs the following SRM database subcomponents, depending on the operating system:

- SRM Oracle Database files  
Installs the optional Oracle daemon on operating systems where Solutions Enabler supports Oracle.
- SRM Sybase Database files  
Installs the optional Sybase daemon on operating systems where Solutions Enabler supports Sybase.
- IBM UDB Database files  
Installs the optional UDB daemon on operating systems where Solutions Enabler supports UDB.

- At the following prompt, specify whether to install the Solutions Enabler SRDF session recovery component. A [**Y**]es response installs the SYMRECOVER component:

```
Install EMC Solutions Enabler SYMRECOVER Components ? [Y]:
```

7. At the following prompt, specify whether to install the Solutions Enabler SMI-S Provider component. A **[Y]**es response installs the SMISPROVIDER component:

```
Install EMC Solutions Enabler SMIS Component ? [N]:
```

8. At the following prompt, specify whether to change the default UNIX file permissions. A **[Y]**es response displays another prompt in which you can specify a new value:

```
Do you want to change default permission on /var/symapi directory from [755] ? [N]:
```

9. At the following prompt, specify whether you want to use the default lockbox password. A **[N]**o response leaves the default password unchanged and the installation continues:

```
Do you want to use the default Lockbox Password? [N]:
```

- A **[Y]**es response results in a confirmation request to make sure you really intend to use the default password for the lockbox:

```
Please confirm that you want to use the default Lockbox Password [N]:
```

A **[N]**o response results in a prompt for the new password:

```
Please enter the Lockbox Password:
```

If the password meets the recommended password complexity, the installation asks you to re-enter the same password for confirmation:

```
Please re-enter the Password for confirmation:
```

---

**Note:** If you choose to use the default lockbox password generated by the installation program, you will have to make a note of it for future use if you need to reset the lockbox Stable System Values or generate certificates for client/server operation. See the *EMC VMAX Family Security Configuration Guide* for a description of how the default lockbox password is generated.

---

---

**Note:** If you change the default lockbox password, the default ECOM password is also changed from `admin/#1Password` to `admin/<specified password during installation>`.

---

10. If you are upgrading, the following prompt displays, asking whether to **move** the previous installation's data files to the `symapi_old` directory. A **[Y]**es response **moves** your persistent data from the `/usr/emc/API/symapi` directory to `/usr/emc/API/symapi_old`. A **[N]**o response retains your persistent data:

```
Do you want to move this data to /usr/emc/API/symapi_old ? [N]:
```

11. At the following prompt, decide whether you want to use the default lockbox password. A **[N]**o response leaves the default password unchanged and the installation continues:

```
Do you want to use the default Lockbox Password? [N]:
```

## Step 5: Complete the installation

This section explains how to complete your Solutions Enabler installation.

## Verifying your installation

To verify your installation, run the following command:

```
./se8030_install.sh -check
```

The output of this command depends on the installation options selected during the installation steps. This command produces an output similar to the following example in a Linux environment:

```
-bash-2.05b# ./se8030_install.sh -check

Checking for Solutions Enabler Native Installer kit Installation.....

Sl No RPM                               Version
----- ---
 1  symcli-base                           8.0.3.1707-0.3
 2  symcli-cert                            8.0.3.1707-0.3
 3  symcli-data                            8.0.3.1707-0.3
 4  symcli-symcli                          8.0.3.1707-0.3
 5  symcli-symrecover                       8.0.3.1707-0.3
 6  symcli-thincore                         8.0.3.1707-0.3
```

## Removing temporary file

During installation, the install script creates the temporary file `/tmp/emc_app_data_path`. This file holds the value that was entered for the install root directory from the previous installation. This value is used as the default install root directory in subsequent installations.

For example:

```
EMC_APPLICATION_PATH: /OPT/EMC
```

In some cases this file will be removed when you reboot your system. If not, you may want to manually remove it to conserve disk space.

## Unmounting the installation disc

To unmount the installation disc, enter:

```
umount mount_point
```

## Installing the Linux I/O module for CKD devices

In a Linux on System z installation on Novell SLES 10, you must load a kernel object file in order to issue I/O to storage arrays by way of CKD devices. In addition, failing to load the object file in an environment where a guest can only see CKD devices will prevent Solutions Enabler from discovering storage arrays.

To load the kernel object file, locate the operating system-specific object in the directory `/usr/symapi/ioctl/SUSE_Version`, and then use the `insmod s390ioctl.ko` command to load it.

For example, to load the kernel object in a SLES 10 Service Pack 1 environment, enter:

```
cd /usr/symapi/ioctl/
cd suse10sp1
insmod s390ioctl.ko
```

## Enabling the Solutions Enabler components

Enable your Solutions Enabler features by entering the appropriate license keys.

**Note:** For instructions, refer to [“Licensing your software” on page 86](#).

## Creating certificate files after initial installation

If the certificate component is not initially installed, and then added by running the installer again or by performing an incremental install, the SSL certificate is not created.

You can create the SSL certificate by entering the following:

```
cd /var/symapi/config/cert
/usr/symcli/bin/manage_server_cert create -pass <lockbox_pwd>
```

where `<lockbox_pwd>` is the lockbox password created during the installation process.

# Installing Solutions Enabler on Windows

You can install/upgrade Solutions Enabler on a Windows host using the InstallShield wizard (described below), the command line (refer to [“Using the command line” on page 65](#)), or a response file (refer to [“Using a response file” on page 68](#)).

**Note:** Solutions Enabler V8.0.3 is fully upgradeable. That is, you do not have to remove the previous version before installing V8.0.3.

**Note:** Before starting this procedure, review the pre-install considerations in [Chapter 1](#).

## Using the InstallShield wizard

To install/upgrade Solutions Enabler using the InstallShield wizard:

1. Open a browser and visit the EMC online support website at <https://support.EMC.com>.
2. Download the installation package for your platform and extract the content to a temporary directory.
3. Save all files and exit all Windows applications.
4. Change directory to the location of the Solutions Enabler kit by entering the following:

```
cd \tmp_directory
```

5. Start the installation program by running the following `se8030-Windows-x64.exe` file.

---

**Note:** If you do not have the required Visual C libraries installed on the host to run Solutions Enabler, you will be prompted to install them. If this is the case, click **Install** in the message dialog.

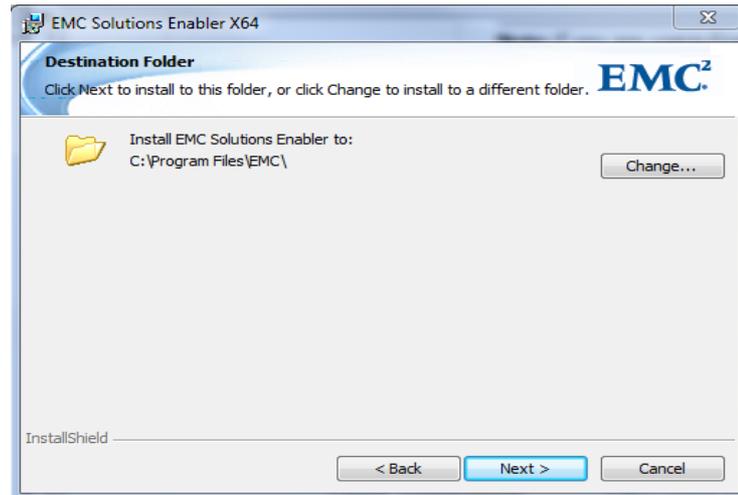

---

---

**Note:** If you are upgrading from a previous version of Solutions Enabler and the installation program detects that there are daemons running, you will be prompted to shut them down. Click **Yes** to shutdown the daemons and continue with the installation. Click **No** to leave the daemons running and exit the installation program.

---

6. In the **Welcome to the Installation program for EMC Solutions Enabler** dialog box, click **Next**.
7. In the **Destination Folder** dialog box, select an installation directory and click **Next**.

**Figure 2** Destination folder dialog box

8. In the **Setup Type** dialog, select **Typical** to install the default components, select **Complete** to install the full Solutions Enabler product set (along with SMI-S and VSS), or select **Custom** to install a subset of the options. Click **Next** when done.

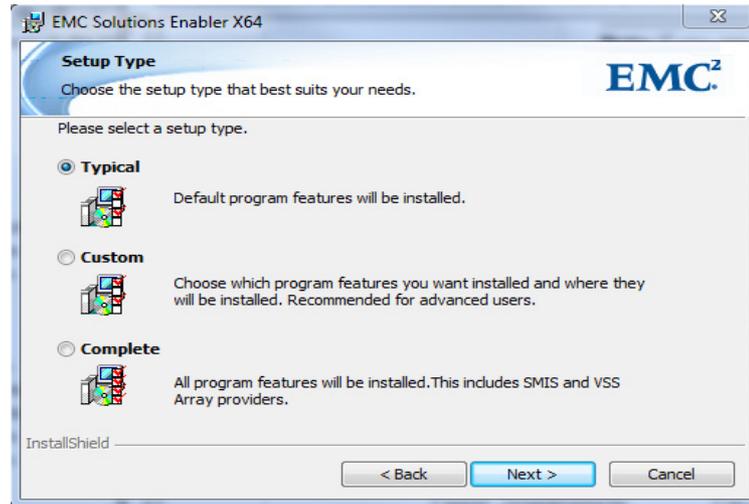

Figure 3 Setup type dialog box

9. If you selected **Custom**, the **Custom Setup** dialog box opens. Select the options, listed in [Table 16 on page 64](#), to install, where to install them, and then click **Next**.

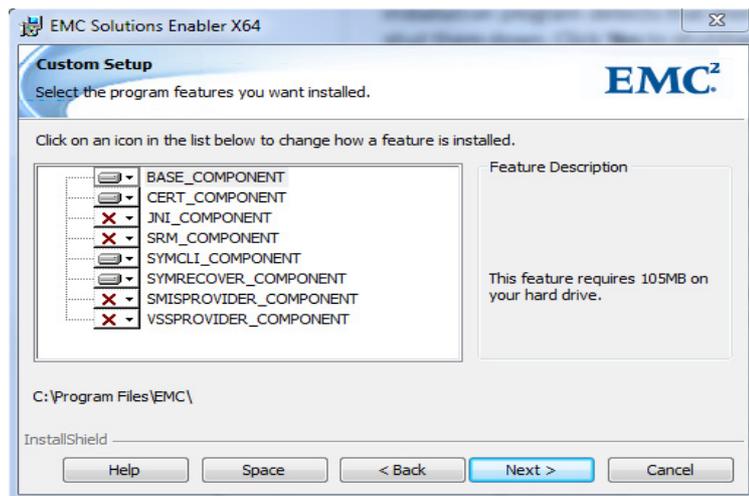

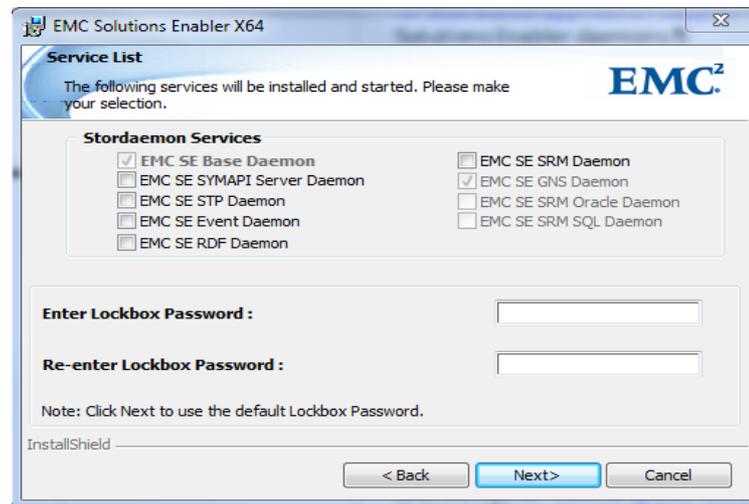

Figure 4 Custom setup dialog box

**Table 16** Windows installation options

Option	Description
BASE_COMPONENT	<p>This option is part of the shared library and runtime environment. It is a co-requisite for other options, and is therefore mandatory for a successful installation.</p> <p>It installs the following:</p> <ul style="list-style-type: none"> <li>• Solutions Enabler core functionality, including symapi, symilm, storapi, storapid, storcore, stordaemon, and storpds.</li> <li>• The <code>storsil</code> and <code>storbase</code> libraries, which provide base storage and host-specific functionality, and an interface to storage arrays for features like I/O scan, device listings, statistics, and showings.</li> <li>• The control storage libraries, which include features like Snap, device masking, and device monitoring.</li> <li>• The Storage Resource Management base mapping library.</li> </ul>
CERT_COMPONENT	<p>Installs the <code>ssl.rnd</code>, <code>symapisrv_install.cnf</code>, <code>symapisrv_trust.pem</code>, <code>symapisrv_trust_v8.0.pem</code> in <code>C:\Program Files\EMC\SYMAPI\config\cert</code>. The subject certificate and key files <code>symapisrv_cert.pem</code>, <code>symapisrv_key.pem</code>, <code>symapisrv_cert_v8.0.pem</code>, <code>symapisrv_key_v8.0.pem</code> will also be generated.<sup>a</sup></p>
JNI_COMPONENT	<p>Installs the Solutions Enabler Java Interface component. You should install this component if your Solutions Enabler application uses a Java interface.</p>
SRM_COMPONENT	<p>Installs the IBM UDB, SQLServer, and Oracle components (depending on the host platform).</p>
SYMCLI_COMPONENT	<p>Installs the collection of binaries known as SYMCLI.</p>
SYMRECOVER_COMPONENT	<p>Installs the SRDF session recovery component.</p>
SMISPROVIDER_COMPONENT	<p>Installs the SMI-S Provider component.</p>
VSSPROVIDER_COMPONENT	<p>Installs the VSS Provider component.</p>

- a. If you do not install SSL certificate files but intends to use secure client/server communication with Solutions Enabler, you must install your own certificate files after the installation is completed. For detailed information on how to do that, please refer to the *EMC VMAX Family Security Configuration Guide*.

10. In the **Service List** dialog, select the services to install/start. The services available in this dialog are based on the installation options you selected. “[Setting up daemons for distributed application support](#)” on page 117 includes descriptions of the Solutions Enabler daemons.

**Figure 5** Service list dialog box

11. Specify the lockbox password and confirm it. If you do not specify a password during installation, the installer will use the default password. If you wish to continue with using the default password, a confirmation message appears saying “Do you want to continue with default password?” For detailed information on the lockbox, please refer to the *EMC VMAX Family Security Configuration Guide*.

**Note:** If you change the default lockbox password, the default ECOM password is also changed from `admin/#1Password` to `admin/<specified password during installation>`.

12. In the **Ready to Install the Program** dialog, click **Install**.
13. In the **Installation Program Complete** dialog box, click **Finish** to complete the setup, and then go to “[Licensing your software](#)” on page 86.

## Using the command line

The `se8030-Windows-x64.exe` is a wrapper for MSI installs. The MSI kit is embedded inside the executable and provides more flexibility.

In general, the `se8030-Windows-x64.exe` is a two step process: first it extracts the MSI kit, and then MSI extracts all the files using `msiexec.exe`.

To install/upgrade Solutions Enabler using the command line:

1. Open a browser and visit the EMC online support website at <https://support.EMC.com>.
2. Download the installation package for your platform and extract the content to a temporary directory.
3. Save all files and exit all Windows applications.

4. Select one of the MSI wrapper script installation options, detailed in the remainder of this section.

---

**Note:** By default, the installation program will generate a verbose log (`SE_RTinstall_Verbose.log`) for each install in the `TEMP` directory.

---

## Silent mode

To install Solutions Enabler in silent mode, enter:

```
start /wait se8030-Windows-x64.exe /s /v/qn
```

Where:

`/S` or `/s` is the silent option for the wrapper script. The `/s` option is used for silent extraction of MSI kit from the wrapper to a temp folder. The `/S` option is not related to the MSI kits.

`/V` or `/v` is the option used by the wrapper to parse the parameters to `msiexec.exe` when MSI kits are run after extraction. In other words, it is a gateway for the `msiexec.exe`. Whatever valid MSI parameters are passed after `/V` will be parsed to the `msiexec.exe`.

`/qn` is a regular `msiexec` option to install the MSI kits in silent mode.

---

**Note:** If the `/s` and `/v` options are entered as capital letters (`/S /V`), and a space is used to separate the `/v` and `/qn` options, the installation starts in Wizard mode.

---

## Non-default location

To install Solutions Enabler in a non-default location, enter:

```
start /wait se8030-Windows-x64.exe
/s /V"INSTALLDIR=C:\EMC /qn"
```

Where:

`/V` or `/v` is the option used by the wrapper script to parse the parameters to `msiexec.exe` when MSI kits are run after extraction. In other words, it is a gateway for the `msiexec.exe`. Whatever valid MSI parameters passed after `/V` will be parsed to the `msiexec.exe`.

`INSTALLDIR` is a `MSIEXEC` public property. By using this as shown in the example, you can redirect your installation to a non default directory.

## Space in directory name

To install in a non-default path with a space in the directory name or path, enter:

```
start /wait se8030-Windows-x64.exe /S
/V"INSTALLDIR=\"C:\Program Files\
Non DefaultPath\" /qn"
```

Where:

`\` is the escape character to insert the codes (“”) if there is a space in the directory path.

/qn is a regular MSIEXEC option to install the MSI kits in silent mode.

## Adding non-default features

To perform a custom install (incremental) to add non-default Solutions Enabler features, enter:

```
start /wait se8030-WINDOWS-x64.exe /S
/V"ADDLOCAL=JNI_COMPONENT,SRM_COMPONENT LOCKBOXPASSWORD=<PASSWORD>
/qn"
```

Where:

ADDLOCAL is a MSIEXEC public property. By using this as shown in the example, you can install optional features.

/qn is a regular MSIEXEC option to install the MSI kits in silent mode.

ADDLOCAL=ALL will perform a complete installation.

---

**Note:** If the LOCKBOXPASSWORD argument is not passed, then the default lockbox password will be used.

---

## Removing non-default features

To perform a custom install (decremental) to remove non-default Solutions Enabler features, enter:

```
start /wait se8030-Windows-x64.exe /s
/V"REMOVE=JNI_COMPONENT,SRM_COMPONENT /qn"
```

Where:

REMOVE is a MSIEXEC public property. By using this as shown in the example, you can remove optional features.

/qn is a regular MSIEXEC option to remove the MSI kits in silent mode.

---

**Note:** REMOVE=ALL will uninstall completely.

---

## Multiple commands

To have multiple commands passed:

```
start /wait se8030-Windows-x64.exe /S /V"INSTALLDIR="C:\Program
Files\Some Folder\
" ADDLOCAL=SRM_COMPONENT /qn"
```

## Overwrite mode

To run installer in overwrite mode:

```
start /wait se8030-Windows-x64.exe /S /V"REINSTALLMODE=VOMUS
REINSTALL=ALL /qn"
```

Where:

REINSTALLMODE & REINSTALL are MSIEXEC public property

/qn is a regular MSIEXEC option to install the MSI kits in silent mode.

## Maintenance mode

To run the installer in Maintenance custom mode:

```
start /wait se8030-Windows-x64.exe /S /V"REINSTALLMODE=VOMUS
ADDLOCAL=SRM_COMPONENT /qn"
```

## Starting services

To start three Solutions Enabler services, use the silent install command:

```
start /wait se8030-Windows-x64.exe /S /V"ADDLOCAL=ALL STORAPID=1
STOREVNTD=1 STORSRVD=1 /qn"
```

Where:

ADDLOCAL=ALL will install every Solutions Enabler feature, including SMI-S and VSS, STORAPID=1 STOREVNTD=1 STORSRVD=1 will install, start, and set the `storapid`, `storevntd`, and `storsrzd` services to start automatically.

## Starting the storstpd daemon

When installing Solutions Enabler on a Windows host, the option to install/start the performance collector service (`storstpd` daemon) in the Select Services dialog box will only install the daemon; it will not start it. To start the daemon after you have finished the installation, use the following command:

```
stordaeomon start storstpd
```

## Default Solutions Enabler components

With the exception of the CORE component, all the following can be blocked from installation using the `REMOVE` command:

```
CERT_COMPONENT
SYMCLI_COMPONENT
SYMRECOVER_COMPONENT
```

## Non-default Solutions Enabler components

The non-default components can be installed using the `ADDLOCAL` command:

```
JNI_COMPONENT
SRM_COMPONENT
```

## Using a response file

Solutions Enabler provides the option of using a response file for installing on Windows hosts.

To install Solutions Enabler using a response file:

```
start /wait se8030-Windows-x64 /s
/V"WSC_CONFIG_FILE=path_to_response_file_with_the_
filename /qn"
```

To use this method, create a response file similar to the following example, and then run the command, specifying the name of your file.

In the response file:

- ◆ Set the components you want to install to True and the components that you do not want to install to False.

- ◆ Set the daemons you want to automatically start to 1 and the daemons you do not want to automatically start to 0.

*Example* Sample response file and contents:

```
[COMPONENTSELECTION]

CERT_COMPONENT:TRUE
SYMRECOVER_COMPONENT:TRUE
JNI_COMPONENT:TRUE
SYMCLI_COMPONENT:TRUE
SRM_COMPONENT:TRUE

[PATHSELECTION]
EMC_ROOT_PATH="C:\Program Files\EMC\"
EMC_DATA_ROOT_PATH="C:\Program Files\EMC\SYMAPI\"
WIDESKY_SDK_KEY="xxxx-xxxx-xxxx-xxxx"

[DAEMONSELECTION]

STORAPID=1
STOREVNTD=0
STORGNSD=0
STORORAD=0
STORRDFD=0
STORSQLD=0
STORSRMD=0
STORSRVD=1
STORSTPD=0
```

## Installing Solutions Enabler on z/OS

This section describes how to install Solutions Enabler on a z/OS host to operate as a SYMAPI server.

The following procedure can be used for either a new installation, or to upgrade an existing installation.

---

**Note:** Before starting this procedure, be sure to review the pre-install considerations in [Chapter 1](#).

---

### Step 1: Copy the files

To copy files:

1. Open a browser and visit the EMC online support website at <https://support.EMC.com>.
2. Download the installation package for z/OS `emc.ssem803.zip` and extract the content to a temporary directory.
3. In the temporary directory, extract the files from the `.zip` file, and then execute the command `uploadSE.bat`.
4. When prompted, provide the following information:
  - The name or IP address of the z/OS host on which you are installing.

- The userid and password to login to the FTP server on the z/OS host, and other optional FTP information.
- The high-level qualifier of the dataset name to use during allocation of the distribution file.
- The name of a volume and esoteric unit name on which to allocate the distribution file.

Once the upload completes, the distribution file will be ready for remaining installation steps.

5. Once the files are uploaded, login to the z/OS host and continue the installation.

---

**Note:** If you plan on running the Solutions Enabler server using secure (SSL) communications, you must create and install the certificates for z/OS before starting the server. To do this, you must run the Windows batch file `zoscert.bat` from the same location you ran the `uploadSE.bat` batch file. You cannot do this until after you have run job #07DFLTS, as this job creates some requisite directories in the UNIX System Services filesystem. [“Installing SSL certificates” on page 172](#) provides more information.

---

## Step 2: Receive the transmit file

The file that you transferred to the host was created using the TSO `TRANSMIT` command. Therefore, you must use the TSO `RECEIVE` command to convert the file to a library of materials that you will use to complete the installation.

To receive the transmit file:

1. Do one of the following:

- From the TSO READY prompt, enter the following command:  
`RECEIVE INDS('high_level_qualifier.EMC.ssem803.XMITFILE')`

Where *high\_level\_qualifier* is the same qualifier used during the CD-based batch upload procedure.

- In the **Utilities.DSList (3.4)** of the main ISPF menu, type **RECEIVE INDS (/)** on the line where the uploaded transmit file is shown in the list.

In either case, the following displays:

```
INMR901I Dataset EMC.ssem803.XMITLIB from
emcdist on NODENAME
INMR906A Enter restore parameters or 'DELETE' or
'END'
```

2. Press **Enter** to accept the allocation of the XMITLIB under your high-level qualifier, or respond with the following to change the allocated dataset name:

```
DSN('ds_prefix.xmitlb')
```

---

**Note:** The dataset name you specify must end in the XMITLIB extension.

---

### Step 3: Extract the additional files from the XMITLIB

Edit the job `EXTRACT` member of the XMITLIB and make the following changes:

1. Add a JOB card to comply with your site's batch JCL standards.
2. Change all occurrences of `ds-prefix` to the desired prefix for your Solutions Enabler libraries.
3. Change all occurrences of `DVOL` to the volume on which you want to allocate the libraries.
4. Change all occurrences of `DISK-UNIT` to the disk unit name that includes the volume you specified in the `DVOL` change above.
5. Submit the job, and look for a zero return code. The `EXTRACT` job creates some temporary data sets which will be deleted by the `#99ECLN` job after the installation is complete. It also creates some data sets for permanent use with Solutions Enabler.

### Step 4: Customize the JCL

Solutions Enabler includes a REXX exec program, SEMJCL, to expedite the JCL customization process by allowing you to create a site-specific ISPF edit macro in your CLIST library and then running it against every member of the RIMLIB whose name starts with a pound sign (#).

---

**Note:** If you prefer to manually customize the JCL, customize the # prefixed members as necessary, and then continue with [“Step 5: Run the jobs” on page 73](#).

---

To use SEMJCL:

1. In the **Utilities.DSList (3.4)** of the main ISPF menu, type the first few qualifiers of your RIMLIB dataset name, and then press **Enter**.

The RIMLIB displays as part of the DSLIST.

2. Scroll to the RIMLIB dataset and type **m** in the command field.

The member list for the RIMLIB dataset displays.

3. Scroll to the SEMJCL member in the RIMLIB, and then type **exec** (or **ex**) in the input area to the left of the member name.

This executes the SEMJCL exec, which displays the customization screen:

```

.----- Customize EMC Solutions Enabler 8.0.3 Electronic Kit Install JCL -----
| Command ==> _____
| Press PF3 to Cancel or PF1 for Help
| Press ENTER to run edit macro SEMX803 which
| will customize the installation JCL
|
|      Data Set Name Prefix:  EMC.SSEM803
|      SMP/E Data Set prefix:  EMC.SMPE
|      SCF Subsystem Id:      EMC
|      SCF Linklib Prefix:    EMC.SSCF720
|      Disk Unit Name:        SYSDA      Disk Volume Serial:  SYM001
|      Time Zone:             EST5
|      SYMAPI Base Directory:  /var/symapi
|
| Enter JOB card below ('%MEMBER%' is replaced by the member name):
| //USERIDA JOB ACCT,'EMC SEM 8.0.3',
| // CLASS=A,                <-- CHANGE IF NEEDED
| // MSGCLASS=A,             <-- CHANGE IF NEEDED
| // NOTIFY=USERID          <-- CHANGE IF NEEDED

```

4. Enter your site-specific information according to the following:

*Tip*

To cancel the SEMJCL, press **PF3** (that is, the **END** key).

- a. In the **Data set name Prefix** field, enter the high-level qualifier and any additional qualifiers to be used when allocating new Solutions Enabler datasets.
- b. In the **SMP/E Data set prefix** field, enter the prefix of the SPM/E datasets where ResourcePak Base is installed.
- c. In the **SCF Subsystem Id** field, enter the subsystem name of the SCF address space. The default is `EMC`.
- d. In the **SCF Linklib Prefix** field, enter the prefix of the SCF load module library corresponding to the subsystem you entered above.
- e. In the **Disk unit name** field, enter a valid unit name defined at your site to be used in the `UNIT=` operand when allocating new Solutions Enabler datasets. The default is `SYSDA`.
- f. In the **Disk Volume Serial** field, enter the volume serial number of the DASD volume where the new Solutions Enabler datasets will be allocated.
- g. In the **Time Zone** field, enter the appropriate setting for your time zone location. This setting must be a POSIX-compliant time zone value. This value is used to set the `TZ` environment variable of the Solutions Enabler task. If you do not supply a value, the time stamps of the Solutions Enabler internal messages written to the log files will default to UTC time.

For example, entering a value of `EST5` will set the time stamp to the United States Eastern Standard Time, 5 hours earlier than UTC.

**The default time zone value is UTC time.**

- h. In the **SYMAPI Base Directory** field, specify the location of the Unix System Services directory under which the SYMAPI runtime directories will be created.

---

**Note:** The userid used in the Solutions Enabler batch jobs must have write access to the entire SYMAPI base directory.

---

- i. In the **Job Card Information** field, specify up to four statements for your job card.

A default job card is filled in, including a place holder for accounting field, programmer name value, CLASS=A, MSGCLASS=A, and NOTIFY operands. The JOBNAME and NOTIFY= operands use the TSO ID of the user running the SEMJCL process.

If you use %member% in the jobname field in the job card, the RIMLIB member name will be used as the job name.

---

**Note:** Statement syntax is not validated until jobs are submitted.

---

- j. Press **Enter**.

SEMJCL generates an edit macro and uses the ISPF editor to apply the specified values to all the installation jobs. At this point in the procedure, all of the installation jobs have been edited with site-specific information and are ready to run.

## Step 5: Run the jobs

Run each of the following jobs:

◆ #01ALLOC

Creates all the datasets not allocated by the \$EXTRACT job for installing the product, and copies sample configuration members from the RIMLIB into the Solutions Enabler PARMLIB.

◆ #04DDDEF

Creates the DD definitions for all three SMP/E global zones.

◆ #05RECEV

Gets the SYSMODS and HOLDDATA. It also gets the FMID function, FMID(SSEM803), which delivers the Solutions Enabler for z/OS software.

---

**Note:** If job #05RECEV fails with the message:

```
GIM23401T the program IEV90 was required for SMP/E but was not
available
```

Run #ASMHA to define IEV90, and then re-run #05RECEV.

---

◆ #06APPLY

Selectively applies the function received in the previous job:

```
apply select(SSEM803)
```

At this point you have installed the load library members into the target load library. The next few jobs execute programs in the load library, which have additional requirements. Be sure to check each program's requirements before submitting each job.

◆ #07DFLTS

**Note:** Before running job #07DFLTS, decide first if you want to use a specific lockbox password as opposed to the default one. Setting up the lockbox password is mandatory and must be completed before running job #10ECCIN. Refer to [“Step 6: Manage z/OS Lockbox password” on page 75](#) before proceeding.

This job assembles and links the assembler source in member #SYMDFLT. #SYMDFLT will have been updated when the exec SEMJCL was run. This job also creates the SYMAPI directory structure, based on your specification of the SYMAPI Base directory on the **SEMJCL Customization** panel.

◆ #08SLMF

Runs the Solutions Enabler License Management Facility (`symlmf`) in batch mode. You must use an editor to customize the input, entering the license keys from the key cards that were received with your Solutions Enabler package.

The `symlmf` program normally runs in batch in z/OS, and the input to the program is specified in the `SYSIN DD` statement. The statements there satisfy the dialog that `symlmf` would normally have with an interactive user on non-z/OS platforms.

The dialog sequence is as follows:

1. At the following prompt, enter **Y** to begin the registration process:

```
Do you want to enter a registration key? Y
```

2. At the following prompt, enter the 19-byte key value as specified on the key card:

```
Enter the license key:
```

3. At the following prompt, enter **Y** to register another key value, or **N** to complete the registration process:

```
Do you want to enter a registration key? N
```

Entering **N** causes `symlmf` to finish updating the license file and end the job step. The sample input below shows the appearance of the `SYSIN DD` statement coded to enter two keys:

```
000045 //SYMLMFI EXEC PGM=SYMLMF
000046 //STEPLIB DD DSN=EMC.SSEM803.LOADLIB,DISP=SHR
000047 //SYSPRINT DD SYSOUT=*
000048 //SYSOUT DD SYSOUT=*
000049 //SYSIN DD *
000050 Y
000051 0000-1111-2222-3333
000052 Y
000053 3333-2222-1111-0000
000054 N
000055 /*
```

---

**Note:** For more on the new licensing mechanism, refer to [“Licensing your software” on page 86](#). For alternative ways of installing licenses in z/OS, refer to [“Installing using alternative methods” on page 103](#).

---

**Note:** From this point on, the Solutions Enabler load library must be APF-authorized. The EMCSCF linklib will have been APF-authorized for SCF to operate. Use the desired method at your site to authorize the Solutions Enabler load library.

Also, the user who runs jobs from this point must have an OMVS segment defined. For more information, refer to [“Before you begin” on page 22](#).

The ResourcePak Base (EMCSCF) address space must be active and must specify the same subsystem identifier (SSID) as the one specified on the JCL Customization panel.

---

◆ #10ECCIN

---

**Note:** The Solutions Enabler Base Daemon (storapid) must be started before job #10ECCIN is run.

---

This job creates the SYMAPI database for SYMCLI clients. Job #10ECCIN attempts to discover every VMAX system connected to your Mainframe host. If there are many VMAX arrays connected, this job may run for a considerable period of time. If there are VMAX arrays that you do not want remote clients to view, you may exclude them from the discover process. See section [“symavoid” on page 115](#) for details on excluding devices.

---

**Note:** If the configuration of any VMAX array attached to a host is changed, then you must re-run job #10ECCIN to correctly discover the changed VMAX array. Alternatively, run a SYMAPI discover from any client which provides this capability.

---

---

**Note:** All 12 digits of the serial number are required.

---

◆ #16CFGCP

Copies the sample configuration files to the SYMAPI configuration directory.

## Step 6: Manage z/OS Lockbox password

Solutions Enabler V8.0 on z/OS has an ISPF interface (SEMLB) for managing the lockbox password. During the z/OS installation phase, the lockbox password will be set to the default value when the job #07DFLTS is run, during this step:

```
//LOCKBOX EXEC PGM=LOCKBOX
```

To complete the lockbox installation, follow these steps:

1. If you wish to have the default lockbox password set during the initial install phase, then continue to step 2.  
If you do not wish to have the default lockbox password set during the initial installation phase, then delete (or comment out) the lockbox step before the job #07DFLTS is run for the first time.

---

**Note:** The lockbox step may be deleted (or commented out) before or after the SEMJCL configuration.

---

2. Complete the SEMJCL setup.
3. Run the job #07DFLTS.
4. Once job #07DFLTS has run (with or without the lockbox step), the SEMLB interface can be used. For details, see [“The SEMLB interface” on page 76](#).

---

**Note:** The lockbox setup process must be completed before any daemons are started and job #10ECCIN is run.

---

5. Start daemons.
6. Run the job #10ECCIN.

---

**Note:** For detailed information about lockbox, please see the *EMC VMAX Family Security Configuration Guide*.

---

## The SEMLB interface

After the #07DFLTS job has run, the SEMLB interface can be used to set the lockbox password. To do this, follow these steps:

1. Navigate using the ISPF option 3.4 to the installation RIMLIB, locate the member SEMLB, and then use `exec` to execute it. The following panel will be displayed:

```

+-----+
|      EMC Solutions Enabler 8.0.3 Lockbox configuration      |
|                                                             |
| Command ==> _____                                     |
|                                                             |
| Enter option 1 or 2 or press PF3 to Cancel                 |
|                                                             |
| 1 - Set or reset the Lockbox Stable System Values         |
| 2 - Change the Lockbox password                           |
|                                                             |
+-----+

```

2. Select option 1. The following panel will be displayed:

```

+-----+
|      EMC Solutions Enabler 8.0.3 Stable System Values reset  |
|                                                             |
| Command ==> _____                                     |
|                                                             |
| Reset the lockbox SSV values:                             |
|                                                             |
|   Press enter to use the default password.                |
|   Otherwise type the password and press enter             |
|                                                             |
| Password                                                  |
| Confirm Password                                         |
|                                                             |
+-----+

```

3. a.> If you ran the lockbox step in #07DFLTS, then enter the default password and press **Enter**. The Stable System Values will be reset.  
b.> If you did not run the lockbox step in #07DFLTS, then enter a new password and press **Enter**. The Stable System Values will be set and the new password will now be in effect.

## Changing the lockbox password

To change the lockbox password, follow these steps:

1. Select option 2 when the SEMLB exec is invoked. The following panel will be displayed.

```

-----
      EMC Solutions Enabler 8.0.3 Lockbox Password change
Command ==>> _____

To change the lockbox password, enter the required passwords.

Current password

New password.

Confirm new password.
-----

```

2. Enter the current lockbox password as well as the new password and press **Enter**. The lockbox password will be changed to the new password.

**Note:** If you change the default lockbox password, the default ECOM password is also changed from `admin/#1Password` to `admin/<specified password during installation>`.

## Quick step summary of lockbox installation

Installation steps using the default lockbox password:

1. Configure using SEMJCL (refer to [“Step 4: Customize the JCL” on page 71](#)).
2. Run #07DFLTS.
3. Change the default lockbox password using SEMLB option 2 (refer to [“Changing the lockbox password” on page 78](#)).
4. Start the daemons.
5. Run #10ECCIN.

Installation using a specific lockbox password:

1. Configure using SEMJCL (refer to [“Step 4: Customize the JCL” on page 71](#)).
2. Delete (or comment out) the lockbox step `//LOCKBOX EXEC PGM=LOCKBOX`.
3. Run #07DFLTS.

4. Set the lockbox password using SEMLB option 1 (refer to [“The SEMLB interface” on page 76](#)).
5. Start the daemons.
6. Run #10ECCIN.

## Step 7: Complete the installation

Do the following to complete the installation:

1. Perform all other customizing and any testing as required. Sample startup jobs are provided in the RIMLIB for the SYMAPI daemons:
  - #STORAPI - Base Daemon
  - #STOREVT - Event Daemon
  - #STORGNS - GNS Daemon
  - #STORSRV - Server Daemon

Note that you can either run STORSRV as a batch job or convert it to run as a started task.
2. Customize and run job #11ACCP. This job accepts the FMID SSEM803 into the distribution zone.
3. By default, control functions such as authorization, SRDF or TimeFinder are allowed from hosts external to the z/OS host (via client/server). To disable this capability, an optional zap must be applied. This zap is located in the RIMLIB in member #12CNTRL. Refer to both that job and [“Remote control operations” on page 178](#) for further details.

Your Solutions Enabler installation is now complete. Next, you need to establish your server environment by performing the configuration and setup procedures explained in [Chapter 5](#).

---

**Note:** If you plan on using the optional Secure Socket Layer (SSL) encrypted communications between the SYMAPI server and its connecting clients, and you plan on running the server in SECURE or ANY modes, you must create and install the SSL certificates before starting the server. For more information, refer to [“Installing SSL certificates” on page 172](#).

---

## Starting over

If, while installing the product, you decide that you want to back out and start the installation over, you can do so up until you run job #11ACCP.

There are two utility jobs in the RIMLIB that allow you to back out of an installation. Both are customized by the SEMJCL process along with other installation JCL. The members are:

- ◆ #99RESTR — Executes the **SMP/E RESTORE** command, which reverses the effect of an APPLY function. Use this job if you have successfully run #06APPLY and want to back out of that step.

- ◆ #99REJECT — Executes the **SMP/E REJECT** command, which reverses the effect of a RECEIVE function. Use this job if you have successfully run #05RECEV and want to back out of that step. You cannot REJECT an FMID that has been applied. You must RESTORE it before REJECTing it.

---

**Note:** #99RESTR and #99REJECT are not normally used in the installation process. You should only use these jobs to redo your installation.

---

## Restoring the RIMLIB

In the event that customization of the RIMLIB has rendered it difficult to work with, you can use job #RIMREST in the RIMLIB to re-create the RIMLIB. This job will create a new RIMLIB with the suffix `.REST` and will not alter the original RIMLIB. However, you should verify that the JCL in #RIMREST is appropriate before running the job.

## Installing Solutions Enabler on OpenVMS

This section describes how to install/upgrade Solutions Enabler on an OpenVMS host.

---

**Note:** Before starting this procedure, review the pre-install considerations in [Chapter 1](#).

---

### Step 1: Accessing the software

Solutions Enabler is distributed as a platform-specific file download from EMC online help at:

<https://support.EMC.com>

Possible filenames are:

SE803RT.SAV	HP Alpha hardware platform.
SE803RIA.SAV	HP Integrity hardware platform.

---

**Note:** Throughout the remainder of this installation procedure, substitute the appropriate filename for any occurrence of the variable *InstallKit*.

---

To access the software from EMC online help:

1. On EMC Online Support, click **Support by Product**. Type **Solutions Enabler** in the “**Find a Product:**” search field and press **Enter**. The Solutions Enabler product page appears.
2. Click **Download** and then the platform-specific installation kit.
3. Save the installation kit to the host’s disk drive and run the following command against it:

```
set file/attr=(RFM:FIX,LRL:32256) InstallKit
```

### Step 2: Install the software

To install the software:

1. Extract the command procedure after setting `[set DEF SYS$SYSDEVICE:[EMC.KITS]` by entering:
 

```
backup/select=instcli.com InstallKit/sav instcli.com;
```
2. With both files (`instcli.com` and `InstallKit`) in the same temporary directory, run the installation procedure by entering:
 

```
@instcli.com
```
3. At the following prompt, specify whether to allow lower privileged users to execute `sym*` commands.
 

```
Do you want to enable lower privilege user capability?
```

A **[y]**es response will enable lower privileged users to execute commands. [Step 6 on page 82](#) describes the privileges these users require.
4. At the following prompt, specify whether to use the default password for the lockbox. This prompt will not appear if the lockbox already exists. For detailed information on the lockbox, please refer to the *EMC VMAX Family Security Configuration Guide*.
 

```
Do you want to use the default password for the lockbox?
```

A **[y]**es response will use the default password. A **[n]**o response will allow users to enter their own password.

If **[n]**o response was entered, the following prompt will be displayed to allow the entry of a lockbox password:

```
The Lockbox password must be at least 8 characters long, contain an
uppercase character, contain a lowercase character, contain a
numeric value and an special character (!@#%&). Enter lockbox
password:
```

The installation produces the following DCL command procedures:

- `emc_cli.com` should be called by the system `login.com` or by each user's login procedure.
- `emc_install_sys_specific.com` is generated to provide a way to install the data directories in the `sys$specific` directory on each node in a cluster. At this point in the installation, this DCL procedure has already been executed on the machine where Solutions Enabler was installed.

---

**Note:** After the installation, all the data files from the installation will be located in the `sys$specific:[emc.symapi]` directories. If there were data files located in a previous installation area, the following files will be copied from the previous installation area to the `sys$specific:[emc.symapi]` directories:

- The `config` directory files are copied from the previous installation area to the `sys$specific:[emc.symapi.config]` directory.

- The database file for the machine on which Solutions Enabler is being installed is

copied from the previous installation area to the `sys$specific:[emc.symapi.db]` directory.

- The log directory files are copied from the previous installation area to the `sys$specific:[emc.symapi.log]` directory.

The previous installation area data files and directories will remain intact until all the nodes in a cluster have executed the `emc_install_sys_specific.com` at which time they could be deleted. Even though they remain intact they are not used by the just installed software.

5. Ensure that each SYMCLI user's login procedure calls the `emc_cli.com` procedure to establish their proper SYMCLI environment.
6. Each user must have the following privileges for the SYMCLI to properly function. Take care when granting these privileges.

NETMBX — Can create network device.

SYSLCK — Can lock system wide resources.

SYSNAM — Can insert in the system logical name table.

CMKRNL — Can change mode to kernel.

In addition to the above privileges, users who will be installing and controlling the daemons, require the following privileges:

DIAGNOSE — Can diagnose devices.

PHY\_IO — Can perform physical I/O.

SHMEM — Can create/delete objects in shared memory.

SYSPRV — Can access objects by way of system protection.

WORLD — Can affect other processes in the world.

Users with lower privileges require the EMCSERVERS right so they can run the `sym*` commands.

7. Set the following minimum process quotas for each user account:

FILLM:1000

BIOLM:300

DIOLM:300

ASTLM:500

ENQLM:4000

BYTLM:500000

WSEXTENT:32768

8. You can use the following formulas to calculate an approximation of the WSdef and Pglquo quotas you should use. Depending on the configuration, you may need to set these values higher. You should re-valuate these values if the configuration changes significantly.

- For the WSdef quota, use the following formula:

$$(B + ((S * SN) + (D * DN) + (V * VN) + (P * PN) + (H * HN) + (G * GN)))$$

- For the Pgfquo quota, use the following formula:

$$(B + (S * SN) + (S * RN) + (D * DN) + (V * VN) + (P * PN) + (H * HN) + (G * GN))$$

Where:

B = Minimum base of 10000 pagelets.

S = 14900 pagelets per array.

SN = Number of locally attached arrays.

RN = Number of remotely attached arrays.

D = Two pagelets per disk.

DN = Number of disks. This is the total number of devices when adding up single devices, RAID members, meta members, etc. that Solutions Enabler will see in *all* arrays attached to the host.

V = One pagelet per volume.

VN = Number of volumes. This is the number of OpenVMS volumes ( $\$1\$DGxxxx$  as well as shadow volumes) that this host will see on all arrays visible to this host.

G = 12 pagelets per group.

GN = Number of groups. This is the total number of Solutions Enabler disk groups that Solutions Enabler will be able to see on all arrays connected to this host.

P = One pagelet per physical disk.

PN = Number of physical disks. This the total number of all devices on all the arrays attached to this host which Solutions Enabler will see.

H = One pagelet per hyper volume.

HN = Number of hyper volumes. This is the total number of hypers visible to Solutions Enabler on all arrays connected to this host.

9. The installation is complete. Go to [“Licensing your software” on page 86](#).

## Installing Solutions Enabler on Solaris 11 Local Zones

Oracle Solaris Zones have been integrated with the new IPS package management tools in Oracle Solaris 11. By default, commands such as `pkginfo` are not available in a local zone. Therefore, you have to install the `SUNWpkgcmds` package before installing Solutions Enabler on a non-global/local zone.

1. Install `SUNWpkgcmds` using below command:

```
pkg install SUNWpkgcmds
```

2. Install Solutions Enabler using install script `se8030_install.sh` or native package installation commands:

```
./se8030_install.sh -install
```

3. The installation is complete. Go to [“Licensing your software”](#) on page 86.

## Upgrading SMI-S Provider

To upgrade SMI-S Provider:

1. Stop **ECOM** service.
2. Make a backup of these folders:

On Windows:

```
C:\Program Files\EMC\ECIM\ECOM\conf\cst  
C:\Program Files\EMC\ECIM\ECOM\conf\ssl
```

On Linux:

```
/opt/emc/ECIM/ECOM/conf/cst  
/opt/emc/ECIM/ECOM/conf/ssl
```

3. Uninstall the existing version of SMI provider.
4. Install SMI Provider V8.0.3 with the Solutions Enabler V8.0.3 installer.
5. Replace the folders mentioned in Step 2 with the backup you made.
6. Start ECOM service.

---

**Note:** Affected platforms are: Windows 64-bit and Linux 64-bit.

---

# CHAPTER 3

## Post-Install for UNIX, Windows, and OpenVMS

After you have installed Solutions Enabler, you need to perform certain follow-up procedures to enable your software's features and to establish your command environment. This chapter provides the follow-up procedures for a Solutions Enabler installation in UNIX, Windows, and OpenVMS environments:

◆ Licensing your software.....	86
◆ Initial steps for post-install of Solutions Enabler.....	110
◆ Setting the CLI path.....	112
◆ Setting the online help path.....	112
◆ Managing database and gatekeeper locking.....	113
◆ Avoidance and selection files.....	114
◆ Changing the default behavior of SYMCLI .....	115
◆ Oracle multiple instances through a remote server.....	116
◆ Setting up daemons for distributed application support.....	117
◆ Managing the base daemon.....	122
◆ Setting up the event daemon for monitoring.....	124
◆ VSS Provider environment variables .....	147
◆ SMI-S Provider Windows authentication settings .....	147
◆ VMAX arrays.....	147
◆ ECOM.....	148
◆ SMI-S Provider runtime settings .....	152
◆ RedHat Enterprise Linux 6.0/6.2 [GA] - x86_64 installation.....	153
◆ Adding the SSL certificate .....	154
◆ Vendor SNIA libraries needed for HBA information .....	155

**Note:** As an alternative to the in-depth UNIX and Windows procedures in this chapter, [“Installation checklist” on page 46](#) provides operating-system-specific checklists with high-level installation and configuration steps that advanced users may find useful.

## Licensing your software

In Enginuity 5875, Solutions Enabler introduced support for Electronic Licensing (eLicensing). eLicensing is an end-to-end license management solution to help you track and comply with software license entitlement. eLicensing leverages embedded locking functions and back-office IT systems and processes. It provides you with better visibility into software assets, easier upgrade, and capacity planning and reduced risk of non-compliance, while still adhering to a strict “do no harm” policy to your operations. This ensures that when upgrades are performed from a VMAX family array running Enginuity versions lower than 5875 to an array running Enginuity 5875 or higher, the VMAX family array is scanned for Enginuity features currently in use that require eLicenses. If Enginuity features are found in use, and there are no eLicenses registered and applied to support their use, they are internally reported as “IN USE,” which allows continued access to the Enginuity features while reporting that these features require proper licensing to ensure compliance. By only reporting this information, it prevents disruption to normal operations of your array and business. If your eLicensing report does display one or more Enginuity features as “IN USE,” it is your responsibility to work with your EMC Sales team to obtain proper eLicensing for those features.

With the introduction of eLicensing, array licensing moved from a host-based model to an array-based model, with the majority of licenses now being stored internally on the storage array.

When installing licenses with eLicensing, you obtain license files from EMC Online Support, copy them to a Solutions Enabler or a Unisphere for VMAX host, and push them out to your arrays. Each license file fully defines all of the entitlements for a specific array, including the type of license (Individual or Enterprise), the licensed capacity, and the date the license was created. If you want to add a product title or increase the licensed capacity of an entitlement, you must obtain a new license file from EMC Online Support and push it out to the storage array.

When managing your licenses, Solutions Enabler, Unisphere for VMAX, EMC z/OS Storage Manager (EzSM), MF SCF native command line, TPF, and IBM i platform console, allow you to view detailed usage reports so that you can better manage your capacity and compliance planning.

---

**Note:** For more information on eLicensing, refer to EMC Knowledgebase article [EMC251709](#) on EMC Online Support.

---

## Licenses

Most VMAX array licenses use the array-based model. However, there are still a number of licenses that remain host-based. In addition, there are a number of retired host-based licenses.

---

**Note:** The process for obtaining the remaining host-based licenses will remain the same as with previous versions of Solutions Enabler.

---

---

**Note:** Management of VMAX arrays requires Solution Enabler license keys but no license keys are required for using VSS Provider V8.0.3.

---

## Array-based licenses for VMAX 100K, 200K, 400K arrays

With the release of VMAX 100K, 200K, 400K arrays, Solutions Enabler enhances support for license bundles. Licenses for new VMAX arrays are available as Suites and Packs, but some software packages are also sold separately, outside the bundles.

Three types of license options are available for new VMAX arrays running HYPERMAX OS 5977:

### Suites

- ◆ **Base Suite:** Available for multi-technology systems only.
- ◆ **Foundation Suite:** Available for multi-technology systems only.
- ◆ **Advanced Suite:** Available for multi-technology systems only.
- ◆ **Local Replication Suite:** Available for both single and multi-technology systems.
- ◆ **Remote Replication Suite:** Available for both single and multi-technology systems.
- ◆ **VMAX OS Suite:** Available for both single and multi-technology systems.
- ◆ **Unisphere Suite:** Available for single-technology systems only.
- ◆ **ProtectPoint Suite:** Available for single-technology systems only.

### Packs

- ◆ **Total Productivity Pack:** this includes the Advanced, Local Replication, and Remote Replication Suites.

### Individual licenses

These items are available for new VMAX arrays running HYPERMAX OS 5977 and are not included in any of the license suites:

- ◆ D@RE
- ◆ STAR
- ◆ SRDF/CE
- ◆ AutoStart
- ◆ VPLEX
- ◆ ESA
- ◆ PowerPath
- ◆ ViPR
- ◆ AppSync
- ◆ Security and Compliance Suite
- ◆ Cloud Tiering Appliance

Table 17 on page 88 lists the license Suites and Packs supported with the new VMAX arrays.

**Table 17 License Suites supported with VMAX 100K, 200K, 400K arrays (page 1 of 5)**

License/Description	Allows you to	With the command
<b>Base Suite</b> Includes: - Engenuity - Dynamic Cache Partitioning - Priority Controls - OR-DM	Virtualize an eDisk for encapsulation	symconfigure
	Use VLUN to migrate from an encapsulated device (use it as a source device)	
	Use an encapsulated device as a clone source	
	Enable cache partitions for a VMAX array	symqos -cp
	Create cache partitions	
	Set cache partitions to Analyze mode	
	Enable priority of service for a VMAX array	symqos -pst
	Set host I/O priority	
	Set copy QoS priority	
	Enable Optimizer functionality, including: <ul style="list-style-type: none"> <li>• Manual mode</li> <li>• Rollback mode</li> <li>• Manual Migration mode</li> </ul>	symoptmz
	Schedule manual swaps	
	Set Optimizer-specific parameters: <ul style="list-style-type: none"> <li>• Device Swap Priority</li> <li>• Any of the Optimizer Advanced Parameters</li> </ul>	
	Set the following Optimizer/FAST parameters: <ul style="list-style-type: none"> <li>• User approval Mode</li> <li>• Maximum Devices to Move</li> <li>• Maximum Simultaneous Devices</li> <li>• Workload Period</li> <li>• Minimum Performance Period</li> </ul>	
	Validate or create VLUN migrations	symmigrate
	Create time window	symoptmz symtw
Create cold pull sessions	symrcopy	

**Table 17** License Suites supported with VMAX 100K, 200K, 400K arrays (page 2 of 5)

License/Description	Allows you to	With the command
<b>Local Replication Suite</b> Includes: - TimeFinder/Clone - TimeFinder/Snap - TimeFinder/SnapVX	Create new native clone sessions	symclone
	Create new TimeFinder/Clone emulations	symmir
	Create new sessions	symsnap
	Duplicate existing sessions	
	Create snap pools	symconfigure
	Create SAVE devices	
	Perform SnapVX Establish operations	symsnapvx
	Perform SnapVX snapshot Link operations	

**Table 17 License Suites supported with VMAX 100K, 200K, 400K arrays (page 3 of 5)**

License/Description	Allows you to	With the command
<b>Remote Replication Suite</b> Includes: - SRDF - SRDF/Asynchronous mode - SRDF/Synchronous mode	Create new RDF groups	symrdf
	Create dynamic RDF pairs in Adaptive Copy mode	
	Create RDF devices	symconfigure
	Convert non-RDF devices to RDF	
	Add RDF mirrors to devices in Adaptive Copy mode	
	Set the dynamic-RDF capable attribute on devices	
	Create SAVE devices	
	Create dynamic RDF pairs in Asynchronous mode	symrdf
	Set RDF pairs into Asynchronous mode	
	Add RDF mirrors to devices in Asynchronous mode	symconfigure
	Create RDFA_DSE pools	
	Set any of the following SRDF/A attributes on an RDF group: <ul style="list-style-type: none"> <li>• Minimum Cycle Time</li> <li>• Transmit Idle</li> <li>• DSE attributes, including:                             <ul style="list-style-type: none"> <li>- Associating an RDFA-DSE pool with an RDF group</li> <li>- DSE Threshold</li> <li>- DSE Autostart</li> </ul> </li> <li>• Write Pacing attributes, including:                             <ul style="list-style-type: none"> <li>- Write Pacing Threshold</li> <li>- Write Pacing Autostart</li> <li>- Device Write Pacing exemption</li> <li>- TimeFinder Write Pacing Autostart</li> </ul> </li> </ul>	
	Create dynamic RDF pairs in Synchronous mode	symrdf
	Set SRDF pairs into Synchronous mode	
	Add an RDF mirror to a device in Synchronous mode	symconfigure

**Table 17** License Suites supported with VMAX 100K, 200K, 400K arrays (page 4 of 5)

License/Description	Allows you to	With the command
<b>Advanced Suite</b> Includes: - Foundation Suite - FAST - FAST.X	Perform tasks available in the Foundation Suite.	
	Create time windows	symoptmz symtw
	Add disk group tiers to FAST policies	symfast
	Enable FAST	
	Set the following FAST parameters: <ul style="list-style-type: none"> <li>• Swap Non-Visible Devices</li> <li>• Allow Only Swap</li> <li>• User Approval Mode</li> <li>• Maximum Devices to Move</li> <li>• Maximum Simultaneous Devices</li> <li>• Workload Period</li> <li>• Minimum Performance Period</li> </ul>	
	Add virtual pool (VP) tiers to FAST policies	
	Set the following FAST VP-specific parameters: <ul style="list-style-type: none"> <li>• Thin Data Move Mode</li> <li>• Thin Relocation Rate</li> <li>• Pool Reservation Capacity</li> </ul>	
	Set the following FAST parameters: <ul style="list-style-type: none"> <li>• Workload Period</li> <li>• Minimum Performance Period</li> </ul>	
	SLO-based provisioning	symconfigure symmsg symcfg
FAST.X operations: <ul style="list-style-type: none"> <li>• Monitor and report eDisk state and track information</li> <li>• Manage external disks, including add, remove, drain, activate operations</li> </ul>	symdisk symcfg symconfigure	
<b>Foundation Suite</b> Includes: - Base Suite - Unisphere Suite	Perform tasks available in the Base and Unisphere Suites.	
<b>Unisphere Suite</b> Includes: - Unisphere for VMAX	Manage VMAX arrays running HYPERMAX OS 5977.	N/A
<b>ProtectPoint Suite</b> Includes: - ProtectPoint	Store and retrieve backup data within an integrated environment containing VMAX and Data Domain arrays.	

**Table 17** License Suites supported with VMAX 100K, 200K, 400K arrays (page 5 of 5)

License/Description	Allows you to	With the command
<b>SRDF Star Suite</b> Includes: - SRDF/Star	Perform a setup to initialize the environment.	symstar
<b>VMAX OS Suite</b> Includes: - Base Suite	Perform tasks available in the Base Suite.	

## Array-based licenses on VMAX 10K, 20K, 40K arrays

Solutions Enabler supports array-based license bundles for VMAX 10K, 20K and 40K arrays running Enginuity 5876 or lower. A license bundle is a single license that enables multiple features. For example, the Symmetrix Remote Replication Suite license bundle enables the SRDF, SRDF/A and SRDF/S features. For Symmetrix 10K and 20K arrays, Solutions Enabler continues to support individual array-based licenses.

[Table 18 on page 93](#) lists the array-based licenses supported with VMAX 10K, 20K and 40K family arrays.

**Table 18** Array-based licenses supported with Symmetrix VMAX 10K, 20K, 40K arrays (page 1 of 3)

License/Description		Allows you to	With the command <sup>a</sup>
Enginuity 40K	Enginuity 10K and 20K <sup>b</sup>		
<b>SYMM_VMAX_Enginuity</b> License for whole array Includes: - Dynamic Cache Partitioning - Symmetrix Priority Controls - Symmetrix Optimizer	<b>SYMM_Model_ENGINUITY</b> License for whole array	Virtualize an eDisk for encapsulation	symconfigure
		Use VLUN to migrate from an encapsulated device (use it as a source device)	
		Use an encapsulated device as a clone source	
	<b>SYMM_Model_DCP<sup>d</sup></b> Dynamic Cache Partitioning	Enable cache partitions for a Symmetrix array	symqos -cp
		Create cache partitions	
		Set cache partitions to Analyze mode	
	<b>SYMM_Model_SPC<sup>d</sup></b> Symmetrix Priority Controls	Enable priority of service for a Symmetrix array	symqos -pst
		Set host I/O priority	
		Set copy QoS priority	
	<b>SYMM_Model_OPTIMIZER<sup>d</sup></b> Symmetrix Optimizer	Enable Optimizer functionality, including:	symoptmz
		<ul style="list-style-type: none"> <li>• Manual mode</li> <li>• Rollback mode</li> <li>• Manual Migration mode</li> </ul>	
		Schedule manual swaps	
		Set the following Optimizer-specific parameters:	
		<ul style="list-style-type: none"> <li>• Device Swap Priority</li> <li>• Any of the Optimizer Advanced parameters</li> </ul>	
Set the following Optimizer/FAST parameters:			
<ul style="list-style-type: none"> <li>• User Approval Mode</li> <li>• Maximum Devices to Move</li> <li>• Maximum Simultaneous Devices</li> <li>• Workload Period</li> <li>• Minimum Performance Period</li> </ul>			
Validate or create VLUN migrations	symmigrate		
Create time window	symoptmz symtw		

**Table 18** Array-based licenses supported with Symmetrix VMAX 10K, 20K, 40K arrays (page 2 of 3)

License/Description		Allows you to	With the command <sup>a</sup>
Enginuity 40K	Enginuity 10K and 20K <sup>b</sup>		
SYMM_VMAX_SRDF_REPLICATION Symmetrix Remote Replication Suite Includes: - SRDF - SRDF/Asynchronous mode - SRDF/Synchronous mode	SYMM_Model_SRDF <sup>c, d</sup> SRDF	Create new RDF groups	symrdf
		Create dynamic RDF pairs in Adaptive Copy mode	
		Create RDF devices	symconfigure
		Convert non-RDF devices to RDF	
		Add RDF mirrors to devices in Adaptive Copy mode	
		Set the dynamic-RDF capable attribute on devices	
	Create SAVE devices		
	SYMM_Model_SRDF_A <sup>d</sup> SRDF/Asynchronous mode	Create dynamic RDF pairs in Asynchronous mode	symrdf
		Set RDF pairs into Asynchronous mode	
		Add RDF mirrors to devices in Asynchronous mode	symconfigure
		Create RDFA_DSE pools	
		Set any of the following SRDF/A attributes on an RDF group: <ul style="list-style-type: none"> <li>• Minimum Cycle Time</li> <li>• Transmit Idle</li> <li>• DSE attributes, including:                             <ul style="list-style-type: none"> <li>- Associating an RDFA-DSE pool with an RDF group</li> <li>- DSE Threshold</li> <li>- DSE Autostart</li> </ul> </li> <li>• Write Pacing attributes, including:                             <ul style="list-style-type: none"> <li>- Write Pacing Threshold</li> <li>- Write Pacing Autostart</li> <li>- Device Write Pacing exemption</li> <li>- TimeFinder Write Pacing Autostart</li> </ul> </li> </ul>	
SYMM_Model_SRDF_S <sup>d</sup> SRDF/Synchronous mode	Create dynamic RDF pairs in Synchronous mode	symrdf	
	Set SRDF pairs into Synchronous mode		
	Add an RDF mirror to a device in Synchronous mode	symconfigure	
SYMM_VMAX_SRDF_STAR SRDF/Star	SYMM_Model_SRDF_STAR <sup>d</sup> SRDF/Star	Perform a setup to initialize the environment	symstar <sup>c</sup>

**Table 18** Array-based licenses supported with Symmetrix VMAX 10K, 20K, 40K arrays (page 3 of 3)

License/Description		Allows you to	With the command <sup>a</sup>
Engenuity 40K	Engenuity 10K and 20K <sup>b</sup>		
SYMMETRIX_VMAX_TIMEFINDER Symmetrix TimeFinder Suite Includes: - TimeFinder/Clone - TimeFinder/Snap	SYMM_Model_TF_CLONE <sup>d</sup> TimeFinder/Clone	Create new native clone sessions	symclone
		Create new TimeFinder/Clone emulations	symmir
	SYMM_Model_TF_SNAP <sup>d</sup> TimeFinder/Snap	Create new sessions	symsnap
		Duplicate existing sessions	
		Create snap pools	symconfigure
Create SAVE devices			
SYMM_VMAX_FAST_TIERING Symmetrix Tiering Suite Includes: - FAST for disk groups - FAST for virtual pools	SYMM_Model_FAST <sup>d</sup> FAST for disk groups	Create time windows	symoptmz symtw
		Add disk group tiers to FAST policies	
		Enable FAST	
		Set the following Optimizer/FAST parameters: <ul style="list-style-type: none"> <li>• Swap Non-Visible Devices</li> <li>• Allow Only Swap</li> <li>• User Approval Mode</li> <li>• Maximum Devices to Move</li> <li>• Maximum Simultaneous Devices</li> <li>• Workload Period</li> <li>• Minimum Performance Period</li> </ul>	
	SYMM_Model_FAST_VP FAST for virtual pools	Create time windows	symoptmz symtw
		Add virtual pool (VP) tiers to FAST policies	
		Enable FAST	
		Set the following FAST VP-specific parameters: <ul style="list-style-type: none"> <li>• Thin Data Move Mode</li> <li>• Thin Relocation Rate</li> <li>• Pool Reservation Capacity</li> </ul>	
SYMM_Model_OR_DM <sup>d</sup> RCOPY	Create hot push sessions	symrcopy	
	Create cold pull sessions		
	Create cold push sessions		
SYMM_VMAX_SMC - Symmetrix Management Console - Unisphere for VMAX	SYMM_Model_SMC - Symmetrix Management Console - Unisphere for VMAX	Manage arrays running Engenuity 5875 Q22011 SR or higher. <sup>d</sup>	N/A

a. For complete command syntax, refer to the *EMC Solutions Enabler SYMCLI Command Reference Guide*.

- b. In the license name, *Model* indicates the array model on which the license is installed. Possible values are: VMAX or VMAXE.
- c. Requires either SYMM\_*Model*\_SRDF\_A, SYMM\_*Model*\_SRDF\_S or SYMM\_VMAX\_SRDF\_REPLICATION licenses.
- d. This license is not required to manage arrays running an Enginuity version lower than 5875.198.148 from a host running SMC V7.3 or higher or Unisphere V1.0 or higher.

## Host-based licenses

Table 19 lists the host-based licenses that remain unchanged on Enginuity 5876 or lower.

**Table 19** Host-based licenses unchanged, regardless of Enginuity level

License/Description	Commands included
FAST for DMX (full device only)	N/A. This feature is only available with Unisphere for VMAX.
TimeFinder (all, including TimeFinder/Mirror)	symioctl symmir symreturn

Table 20 lists the host-based licenses required to perform operations on VMAX arrays running Enginuity versions lower than 5875 from a Solutions Enabler V8.0 host.

**Table 20** Host-based licenses required for Enginuity versions lower than 5875

License	Commands included
Dynamic Cache Partitioning	symqos -cp
FAST	symfast symtier
Optimization	symmigrate symoptmz
Open Replicator/DM	symrcopy
SRDF	symrdf add RDF group symconfigure add RDF mirror symconfigure create SAVE devices symconfigure set dynamic RDF attribute
SRDF/Async	symrdf set mode async symconfigure SRDF/A settings and add RDF mirror symrdf create dynamic pair in asynchronous mode
SRDF/Star	symstar <sup>a</sup>
SRDF/Synchronous	symconfigure add rdf mirror symrdf create dynamic pair in synchronous mode
Symmetrix Priority Control	symqos -pst
TimeFinder/Clone	symclone and symmir (using clone emulation)
TimeFinder/Snap	symsnap symconfigure create snap pool and SAVE devices

a. Also requires SRDF/A and SRDF/S licenses.

## Retired licenses

The following licenses are retired. The features that required these licenses still exist, they just no longer require licenses.

- ◆ Base
- ◆ Cache
- ◆ Configuration Manager
- ◆ Config Mgr - Create VDEVs (Snap Configure)
- ◆ Delta Mark
- ◆ Device Masking
- ◆ IPsec
- ◆ Open Replicator/LM
- ◆ Secure Erase
- ◆ SRDF/Automated Replication
- ◆ SRDF/Cascading RDF
- ◆ SRDF/Consistency Groups
- ◆ SRM\_BASE
- ◆ SRM\_Enabler
- ◆ SRM\_FULL
- ◆ SYMAPI Server
- ◆ TimeFinder/Consistency Groups
- ◆ TimeFinder/Exchange Integration Module
- ◆ TimeFinder/SQL Integration Module
- ◆ Virtual Provisioning
- ◆ Worm

## Managing arrays running different Engenuity versions

The operations that you can perform from a host are based on the host-based licenses in the host's `symapi_licenses.dat` file, if any, and the array-based licenses in the array's feature registration database (Engenuity 5875 or higher).

---

**Note:** The location of this `symapi_licenses.dat` file varies according to the operating system. For more information, refer to [Appendix E](#).

---

The remainder of this section describes how the operations you can perform from a Solutions Enabler host are determined when accessing various Engenuity versions.

### Solutions Enabler V7.4 (or higher) host

When accessing an array running Engenuity 5875 or higher from a host running Solutions Enabler V7.4 or higher, the operations you can perform on the array are based on:

- ◆ The licenses in the array's feature registration database ([Table 18 on page 93](#)).
- ◆ The licenses in the host's `symapi_licenses.dat` file, if using any of the host-based features listed in [Table 19 on page 96](#).

When accessing an array running an Engenuity version lower than 5875 from the same host, the operations you can perform on the array are based on the licenses in the host's `symapi_licenses.dat` file, if using any of the host-based features listed in [Table 19 on page 96](#) and [Table 20 on page 96](#). If not, you can only perform operations that do not require a license (see ["Retired licenses" on page 97](#)).

When accessing an array upgraded from Enginuity 5874 to Enginuity 5875 or higher from a host upgraded to Solutions Enabler V7.4 or higher, any product title that you were currently using will still function (even if it does not have an entitlement). However, to use any of the new Enginuity 5875 product titles or any of the older product titles you were not using, you must obtain and install an array-based license file on the array. [“Installing array-based licenses” on page 102](#) describes how to install license files.

## Capacity measurements

Array-based licenses include a *capacity licensed* value that defines the scope of the license. The method for measuring this value depends on the license’s *capacity type* (Usable, Raw, Registered, Engine, or External).

Not all product titles are available in all capacity types, as shown in [Table 21](#) and [Table 22](#).

**Table 21** Product title capacity types for VMAX 100K, 200K, 400K arrays

Usable	Registered	Engine
Base Suite	ProtectPoint Suite	Base Suite
Remote Replication Suite	Remote Replication Suite	Remote Replication Suite
Local Replication Suite	Local Replication Suite	Local Replication Suite
Advanced Suite		Advanced Suite
Foundation Suite		Foundation Suite
Unisphere Suite		Unisphere Suite
SRDF Star Suite		SRDF Star Suite
VMAX OS Suite		VMAX OS Suite

**Table 22** Product title capacity types for Symmetrix VMAX 10K, 20K, 40K arrays

Raw only	Raw or Registered	External
Enginuity	SRDF/Asynchronous mode <sup>a</sup>	SRDF/Asynchronous mode <sup>a</sup>
Dynamic Cache Partitioning	SRDF/Synchronous mode <sup>a</sup>	SRDF/Synchronous mode <sup>a</sup>
Symmetrix Optimizer	SRDF/Star	SRDF/Star
Symmetrix Priority Controls	Synthesized SRDF <sup>b</sup>	TimeFinder/Clone <sup>c</sup>
Unisphere for VMAX	TimeFinder/Clone <sup>c</sup>	TimeFinder/Snap <sup>c</sup>
	TimeFinder/Snap <sup>c</sup>	FAST for virtual pools <sup>d</sup>
	FAST for disk groups <sup>d</sup>	
	FAST for virtual pools <sup>d</sup>	
	RCOPY	

- a. With Enginuity 5876, this license is enabled by the Symmetrix Remote Replication Suite.
- b. Created from SRDF/A and SRDF/S entitlements in the license file.
- c. With Enginuity 5876, this license is enabled by the Symmetrix TimeFinder Suite.
- d. With Enginuity 5876, this license is enabled by the Symmetrix Tiering Suite.

## Usable capacity

Usable Capacity is defined as the amount of storage available for use on a VMAX array. The usable capacity is calculated as the sum of all Storage Resource Pool (SRP) capacities available for the user to use. This capacity does not include any external storage capacity.

---

**Note:** Licenses for the new VMAX arrays are available only in Usable, Registered, or Engine capacity.

---

---

**Note:** For HYPERMAX OS 5977, all devices are under FAST control. The usable capacity for FAST is the usable capacity of the array.

---

## Engine capacity

Engine capacity is defined as the number of engines in the VMAX array.

## Raw capacity

Raw capacity is the sum of the rated capacity of all disks of type SATA or non-SATA in the array (in TB, where 1kB = 1000 bytes), excluding spares for that type.

The type of raw capacity disks can be the SATA disks in the array, or the non-SATA disks in the array (both types can and do appear in the license file).

## Registered capacity

Registered capacity is the amount of user data that will be managed or protected by each particular product title. It is independent of the type or size of the disks in the array.

---

**Note:** New VMAX licenses are available only in Usable, Registered, or Engine capacity.

---

The methods for measuring registered capacity depends on whether the licenses are part of a bundle or individual.

### Registered capacity for license bundles

For license bundles, registered capacity is measured according to the following:

- ◆ Tiering Suite:
  - The registered capacity for this bundle is measured as the sum of the registered capacity of all devices associated with all FAST\_VP policies and the registered capacity of all devices associated with all FAST policies not associated with a FAST\_VP policy.
  - For virtually provisioned devices, the registered capacity is equal to the total space allocated to the thin device. For devices that have compressed allocations, the un-compressed size is used.
  - For disk group provisioned devices, the registered capacity is equal to the total size of the device.
- ◆ Remote Replication Suite:
  - The registered capacity for this bundle is measured by the amount of data that can be stored in all forms of RDF devices (R1s, R2s, and R21s) on a storage array.

- Concurrent SRDF sources are counted only once when measuring registered capacity usage.
- In the case of diskless RDF (Extended Data Protection), no registered capacity is reported as used.
- For virtually provisioned devices, the registered capacity is equal to the total space allocated to the thin device. For devices that have compressed allocations, the un-compressed size is used.
- For disk group provisioned devices, the registered capacity is equal to the total size of the device.
- ◆ TimeFinder Suite:
  - The registered capacity of this bundle is measured as the sum of the capacity of a device if it is a clone source or target, a snap source, or SAVE device in a snap pool. Regardless of whether a device meets two or more of the following criteria, it is only counted once.
  - For virtually provisioned devices, the registered capacity is equal to the total space allocated to the thin device. For devices that have compressed allocations, the un-compressed size is used.
  - For disk group provisioned devices, the registered capacity is equal to the total size of the device.

### **Registered capacity for individual licenses**

For individual licenses, registered capacity is measured according to the following:

- ◆ FAST registered capacity is measured as the sum of the registered capacity of all devices that are associated with all FAST policies that contain disk group tiers.
- ◆ FAST VP registered capacity is measured as the registered capacity of all devices that are associated with all FAST policies that contain virtual pool tiers.
- ◆ SRDF registered capacity is measured as the configured size of all forms of RDF standard devices (R1s, R2s, and R21s). In the case of thin devices, it is the size of allocated tracks associated with all forms of RDF devices (R1s, R2s, and R21s).
  - Concurrent SRDF sources are counted only once when measuring registered capacity usage.
  - In the case of diskless RDF (Extended Data Protection), no registered capacity is reported as used.
- ◆ SRDF/Star registered capacity is measured as the configured size of all standard devices participating in Star configurations. In the case of thin devices, it is the size of allocated tracks on devices associated with Star configurations.
- ◆ TimeFinder/Clone registered capacity is measured as the configured size of all standard devices that are clone sources or clone targets. In the case of thin devices, it is the size of allocated tracks on devices that are clone sources or clone targets.

The registered capacity of a device that is both a clone target and a clone source for another is counted once.

- ◆ TimeFinder/Snap registered capacity is measured as the configured size of all save pools, plus the configured size of all standard devices that are snap source devices. In the case of thin devices, it is the size of allocated tracks on devices that are snap source devices.
- ◆ ProtectPoint registered capacity is the sum of all DataDomain encapsulated devices that are link targets. When there are TimeFinder sessions present on an array with only a ProtectPoint license and no TimeFinder license, the capacity is calculated as the sum of all DataDomain encapsulated devices with link targets and the sum of all TimeFinder allocated source devices and delta RDPs.

The following devices are not counted in registered capacity:

- ◆ SAVE devices not in any pool
- ◆ DATA devices not in any pool
- ◆ Devices not associated with RDF or TimeFinder

Registered capacity is reported in a tenth of a terabyte format (for example, 42.3 TB) and rounded up or down to the nearest GB. For example, 42.31 TB and 42.25 TB will round to 42.3 TB.

## External capacity

External capacity is measured by the sum of the sizes of virtualized LUNs from external storage.

If the entitlement is licensed for registered capacity, any external usage will be added together with the internal usage.

## Installing array-based licenses

This section explains how to use the `symlmf add` command to install array-based licenses.

---

**Note:** Installing licenses requires an authorization role of Storage Admin or higher.

---

You can only install array-based licenses from a host running one of the following operating systems:

- ◆ Windows: AMD64
- ◆ Linux: AMD64, ia64
- ◆ Solaris: 64 bit (Sparc)
- ◆ HP-UX 11.21: ia64
- ◆ AIX 5.3 and 6.1: PPC 64

For instructions on installing from a host running a supported operating system, refer to [“Installing from a supported host” on page 102](#). For instructions on installing from a host running a non-supported operating system, refer to [“Installing using alternative methods” on page 103](#).

---

**Note:** To obtain array-based licenses from EMC Online Support you will need the License Authorization Code (LAC) identification number from the LAC letter e-mailed to you.

---

### Installing from a supported host

To install an array-based license file from a host running a supported operating system:

1. Obtain a license file from EMC Online Support and copy it to your host.
2. Use the following `symlmf` command to push the license file to the VMAX array:

```
symlmf add -type emclm -sid SymmID -file FileName -v
```

Where:

*SymmID* — Specifies the array on which you are installing the license file.

*FileName* — Specifies the name of the license file.

Output similar to the following appears:

```
License SYMM_VMAX_SPC 000000001234 15-Jan-2014: Processed successfully
License SYMM_VMAX_DCP 000000001234 15-Jan-2014: Processed successfully
License SYMM_VMAX_FAST_VP 000000001234 15-Jan-2014: Processed successfully
License SYMM_VMAX_FAST 000000001234 15-Jan-2014: Processed successfully
License SYMM_VMAX_OPTIMIZER 000000001234 15-Jan-2014: Processed successfully
License SYMM_VMAX_TF_SNAP 000000001234 15-Jan-2014: Processed successfully
License SYMM_VMAX_TF_CLONE 000000001234 15-Jan-2014: Processed successfully
License SYMM_VMAX_SRDF_STAR 000000001234 15-Jan-2014: Processed successfully
License SYMM_VMAX_SRDF_S 000000001234 15-Jan-2014: Processed successfully
License SYMM_VMAX_SRDF_A 000000001234 15-Jan-2014: Processed successfully
License SYMM_VMAX_SRDF 000000001234 15-Jan-2014: Processed successfully
License SYMM_VMAX_ENGINUITY 000000001234 15-Jan-2014: Processed successfully
License SYMM_VMAX_OR-DM 000000001234 15-Jan-2014: Processed successfully
License SYMM_VMAX_SMC 000000001234 15-Jan-2014: Processed successfully
Total Licenses Processed:          13
Total host-based eLicense ignored: 0
Total Licenses Not Processed:      0
```

---

**Note:** Issuing the `add` command without the `-v` option will eliminate all but the last three lines of the above output.

---

## Installing using alternative methods

To install an array-based license file from a host running a non-supported operating system, use one of the following methods:

- ◆ Run `symlmf` directly on the VMAX service processor. This method requires that you contact EMC Customer Support.
- ◆ Run `symlmf` on one of the unsupported platforms via client/server to a SYMAPI server on one of the supported platforms.

## Installing host-based licenses

---

**Note:** Installing licenses requires an authorization role of Storage Admin or higher.

---

To install a host-based license:

1. Use the following `symlmf` command to install a license key on a host:

```
symlmf add -type se -license LicenseNumber
```

2. Use the following command to list the licenses installed on the host:

```
symlmf list -type se
```

## Displaying licenses

The procedures in this section explain how to use the `symlmf list` command to display installed licenses.

---

**Note:** For field descriptions of the output examples in this section, refer to [“symlmf list output field descriptions” on page 107](#).

---

## Displaying array based licenses

To display the current array based licenses activated by a license file, use the following command:

```
symmlmf list -type emclm -sid SymmID
```

Output similar to the following appears:

```
Symmetrix ID : 000000001234  
Issue Date  : 03/22/2015
```

Name	Activation		Capacity	Licensed	Install
	Type	ID	Type		Date
Foundation_Suite	P-IND	111111111	Usable-TB	500	09/13/2014
Remote_Replication_Suite	P-IND	1234567	Usable-TB	500	09/13/2014

Legend:

Activation Type:

E-IND = Evaluation Individual

P-IND = Permanent Individual

P-ENT = Permanent Enterprise Agreement

If individual licenses had been purchased, output similar to the following appears:

```
Symmetrix ID : 000194901138
Issue Date   : 03/22/2015
```

Feature Name	Activation		Capacity		Install Date
	Type	ID	Type	Licensed	
SYMM_VMAX_ENGINUITY	P-IND	102938475	R-TB-Non-SATA R-TB-SATA	100 500	08/22/2014
SYMM_VMAX_FAST	P-IND	1234567	Reg-TB	60	08/22/2014
SYMM_VMAX_OR_DM	P-IND	1234567	Reg-TB	10	08/22/2014
SYMM_VMAX_PROSPHERE	P-IND	1234567	R-TB-Non-SATA R-TB-SATA	100 500	08/22/2014
SYMM_VMAX_SMC	P-IND	1234567	R-TB-Non-SATA R-TB-SATA	100 500	08/22/2014
SYMM_VMAX_SRDF	P-IND	1234567	Reg-TB	30	08/22/2014
SYMM_VMAX_SRDF_S	P-IND	1234567	Reg-TB	20	08/22/2014
SYMM_VMAX_SRDF_STAR	P-IND	1234567	Reg-TB	40	08/22/2014
SYMM_VMAX_TF_CLONE	P-IND	1234567	Reg-TB	50	08/22/2014

Legend:

Activation Type:

E-IND = Evaluation Individual  
P-IND = Permanent Individual  
P-ENT = Permanent Enterprise Agreement

In addition, you can also add the `-output xml_element` option to the above command to produce an XML report containing the same information. For example:

```
symmlmf list -type emclm -sid SymmID -output xml_element
```

## Displaying host-based licenses

To display host-based licenses, use the following command:

```
symlmf list -type host
```

Output similar to the following appears:

```
Host ID: host1234
```

Feature Name	SymmID	Days		Capacity	
		Until Expr	Type	Units	
OraclePak	-	-	-	-	-
SPA_BASE	000000001234	-	R-TB	1000	

Legend:

Capacity:

- R-TB = Raw capacity in TB
- REG-TB = Configured capacity in TB
- = Not applicable

In addition, you can also add the `-output xml_element` option to the above command to produce an XML report containing the same information. For example:

```
symlmf list -type host -output xml_element
```

## Displaying host and array-based licenses

To display the host-based and array-based licenses that apply to VMAX arrays, use the following command:

```
symmlf list -type sym -sid 1234
```

Output similar to the following appears:

```
Symmetrix ID: 000000001234
```

Feature Name	Lic	Type	Capacity	Units
SYMM_UNPROT_SDR	SE	N/A		-
SYMM_VMAX_ENGINUITY	EMCLM	R-TB-Non-SATA		100
		R-TB-SATA		500
SYMM_VMAX_FAST_TIERING	EMCLM	R-TB-Non-SATA		100
		R-TB-SATA		500
		R-TB-EXTERNAL		300
SYMM_VMAX_OR_DM	EMCLM	R-TB-Non-SATA		100
		R-TB-SATA		500
		R-TB-EXTERNAL		300
SYMM_VMAX_PROSPHERE	EMCLM	R-TB-Non-SATA		100
		R-TB-SATA		500
		R-TB-EXTERNAL		300
SYMM_VMAX_SMC	EMCLM	R-TB-Non-SATA		100
		R-TB-SATA		500
		R-TB-EXTERNAL		300
SYMM_VMAX_SRDF_REPLICATION	EMCLM	R-TB-Non-SATA		100
		R-TB-SATA		500
		R-TB-EXTERNAL		600
SYMM_VMAX_SRDF_STAR	EMCLM	R-TB-Non-SATA		100
		R-TB-SATA		500
		R-TB-EXTERNAL		300
SYMM_VMAX_TIMEFINDER	EMCLM	R-TB-Non-SATA		100
		R-TB-SATA		500
		R-TB-EXTERNAL		300

Legend:

```
Lic(ense Type):
  EMCLM = emclm license
  SE     = se license
```

In addition, you can also add the `-output xml_element` option to the above command to produce an XML report containing the same information. For example:

```
symmlf list -type sym -sid SymmID -output xml_element
```

## symmlf list output field descriptions

The following explains the output for the `symmlf list` command:

- ◆ **Activation ID:** Activation ID assigned to the license.
- ◆ **Activation Type:** The feature's license can be assigned to:
  - Individual storage arrays,
  - Individual storage arrays but with a limited **Eval**(uation) time period, or to
  - All the storage arrays in the **Ent**(erprise).

- ◆ **Capacity Licensed:** The maximum quantity of data which the functionality of the software is licensed to use, in Terabytes. If the capacity type is **Engine**, this is the maximum quantity of engines which the functionality of the software is licensed to use.
- ◆ **Capacity Type:** Qualifies the capacity licensed. Possible values are:
  - **R-TB-Non-SATA:** Indicates that the capacity licensed applies to the raw capacity of all devices on the array, excluding SATA.
  - **R-TB-SATA:** Indicates that the capacity licensed applies to the raw capacity of all SATA devices on the array.
  - **REG-TB:** Indicates that the capacity licensed applies to the registered capacity of the VMAX array.
  - **Usable-TB:** Indicates that the capacity licensed applies to the usable capacity of the VMAX array.
  - **R-TB External:** Indicates that the capacity licensed applies to the raw capacity of the virtualized LUNs in external storage.
  - **Engine:** Indicates that the capacity licensed applies to the number of engines in the VMAX array.
- ◆ **Capacity Units:** The maximum quantity of data for which the functionality of the software is licensed to use, in Terabytes. If the capacity type is **Engine**, this is the maximum quantity of engines which the functionality of the software is licensed to use.
- ◆ **Days Until Expr:** Displays the number of days until expiration. For a Permanent license, this field displays a hyphen (-). This field only applies to Unisphere for VMAX.
- ◆ **Expiration Date:** Displays the expiration date. For a Permanent license, this field displays a hyphen (-).
- ◆ **Feature Name:** The name of the licensed feature.
- ◆ **Install Date:** The date the license was installed.
- ◆ **Lic(ense Type):** Whether the license is host-based (**SE**) or array-based (**EMCLM**).
- ◆ **SymmID:** The array to which the license is applied.

## Querying licenses

The `symmf query` command displays the current state and usage numbers for all licenses activated on a VMAX array.

For example, to display the state and usage number for all activated licenses on the VMAX3 array 1234, enter the following:

```
symmf query -type emclm -sid 1234
```

Output similar to the following appears:

Symmetrix ID : 000000001234  
 Issue Date : 03/22/2015

Feature Name	Act	Type	Capacity	
			Licensed	Usage
Advanced_Suite	ENT	Usable-TB	500	300.4
Foundation_Suite	ENT	Usable-TB	500	300.4
Remote_Replication_Suite	ENT	Usable-TB	500	300.4
DARE	ENT	Usable-TB	ARRAY	300.4

Legend:

Act(ivation Type):  
 ENT = Entitlement  
 USE = In Use

If individual licenses had been purchased, output similar to the following appears:

Symmetrix ID : 000000001234  
 Issue Date : 03/22/2015

Feature Name	Act	Type	Capacity	
			Licensed	Usage
SYMM_VMAX_ENGINUITY	ENT	R-TB-Non-SATA	100	19.2
		R-TB-SATA	500	128.0
SYMM_VMAX_FAST_TIERING	ENT	Reg-TB	60	0.0
SYMM_VMAX_OR_DM	ENT	R-TB-Non-SATA	100	19.2
		R-TB-SATA	500	128.0
		R-TB-EXTERNAL	300	0.0
SYMM_VMAX_PROSPHERE	ENT	R-TB-Non-SATA	100	19.2
		R-TB-SATA	500	128.0
		R-TB-EXTERNAL	300	0.0
SYMM_VMAX_SMC	ENT	R-TB-Non-SATA	100	19.2
		R-TB-SATA	500	128.0
		R-TB-EXTERNAL	300	0.0
SYMM_VMAX_SRDF_REPLICATION	ENT	Reg-TB	10	0.1
SYMM_VMAX_SRDF_STAR	ENT	Reg-TB	20	0.0
SYMM_VMAX_TIMEFINDER	ENT	Reg-TB	80	0.0

Legend:

Act(ivation Type):  
 ENT = Entitlement  
 USE = In Use

Where:

- ◆ **Feature Name:** The name of the licensed feature.
- ◆ **Act(ivation):** How the product title was activated. Possible values are:
  - **ENT:** Indicates that the product title is activated through an entitlement.
  - **USE:** Indicates that the product title is activated because it was in use prior to upgrading from Enginuity 5874 to Enginuity 5875. In addition, this can also indicate that the product title was entitled in an earlier license file and not the current license file.

Product titles in use (USE) are not considered properly entitled, in which case you should contact EMC for proper entitlement.

- ◆ **Capacity Type:** Qualifies the capacity licensed. Possible values:
  - **R-TB-Non-SATA:** Indicates that the capacity licensed applies to the raw capacity of all devices on the array, excluding SATA.
  - **R-TB-SATA:** Indicates that the capacity licensed applies to the raw capacity of all SATA devices on the array.
  - **REG-TB:** Indicates that the capacity licensed applies to the registered capacity of the VMAX array.
  - **Usable-TB:** Indicates that the capacity licensed applies to the usable capacity of the VMAX array.
  - **R-TB External:** Indicates that the capacity licensed applies to the raw capacity of the virtualized LUNs in external storage.
  - **Engine:** Indicates that the capacity licensed applies to the number of engines in the VMAX array.
- ◆ **Capacity Licensed:** The maximum quantity of data which the functionality of the software is licensed to use, in Terabytes. If the capacity type is **Engine**, this is the maximum quantity of engines which the functionality of the software is licensed to use
- ◆ **Capacity Usage:** The amount of Capacity Licensed currently being used.

In addition, you can also add the `-output xml_element` option to the above command to produce an XML report containing the same information. For example:

```
symlmf query -type emclm -sid SymmID -output xml_element
```

## Deleting licenses

Use the following command to delete a host-based license:

```
symlmf delete -type se -license LicenseName
```

Where *LicenseName* is one of the licenses in [Table 19 on page 96](#) and [Table 20 on page 96](#).

---

**Note:** You cannot delete array-based licenses.

---

## Initial steps for post-install of Solutions Enabler

This section describes the initial steps you must consider before you begin using Solutions Enabler SYMCLI commands.

### Building the SYMAPI database

Before using the SYMCLI commands, you need to run the `symcfg discover` command to build your configuration (SYMAPI) database. This needs to be done once after installation, and after any changes are made to your VMAX array configuration.

## Setting environment variables

After installing Solutions Enabler, you should set the environment variables or paths so you can directly access both the SYMCLI commands and the online help (man pages). The online help path allows you direct access to descriptions of the command set.

---

**Note:** For information on setting these variables, refer to [“Setting the CLI path” on page 112](#) and [“Setting the online help path” on page 112](#).

---

SYMCLI also provides additional environment variables that you can preset to streamline your command line session. These variables can be set to common argument values for a series of associated commands, which eliminates repeated key strokes for your session.

To view a list of environment variables that can be set for a given SYMCLI session, enter:

```
symcli -env
```

To view the environment variables that you currently have set, enter:

```
symcli -def
```

---

**Note:** For a complete list of the SYMCLI environment variables, refer to the *EMC Solutions Enabler SYMCLI Command Reference Guide*.

---

## Setting access permissions to directories

By default, the completed Solutions Enabler installation disables write access to other users beyond the owner. If you desire a different permission scheme, you can change it now. Refer to the *EMC VMAX Family Security Configuration Guide* for more information.

## Starting the SCSI generic driver

Linux Kernel 2.4 requires that the SCSI generic driver be running. You can either compile it into the kernel or compile it as a loadable kernel module.

---

**Note:** For instructions, refer to the `README` file in the top level directory of your Linux source package.

---

---

**Note:** The SCSI generic driver is not required in Linux Kernel 2.6 or higher.

---

## Verifying the existence of dedicated gatekeepers

To verify that there are dedicated gatekeepers available for use, run the following command:

```
stordaemon action storapid -cmd show -gk_stats
```

---

**Note:** For more information on this command, refer to [“Displaying gatekeeper statistics” on page 212](#).

---

## Setting the CLI path

Before using SYMCLI, append the SYMCLI binary directories to your PATH environment variable according to your operating system.

### UNIX

For UNIX C shell, ensure the following SYMCLI directory is appended to variable PATH:

```
set path = ($path /usr/symcli/bin)
```

For UNIX Korn or Bourne shell, ensure the following SYMCLI directory is appended to variable PATH:

```
PATH=$PATH:/usr/symcli/bin  
export PATH
```

### Windows

For Windows, ensure the following SYMCLI directory is appended to the MS-DOS variable PATH:

```
C:\Program Files\EMC\SYMCLI\bin
```

### OpenVMS

For OpenVMS, ensure the following SYMCLI directory has been defined for all users (use `emc_cli.com` in the system `login.com`):

```
SHOW LOGICAL SYMCLI$BIN
```

## Setting the online help path

A complete set of online help (man pages) is provided for SYMCLI. To access these man pages in your environment, perform the following tasks according to your operating system.

### UNIX

For UNIX C shell, ensure the following man page directories are added to variable MANPATH:

```
set MANPATH = ($MANPATH /usr/storapi/man /usr/storapi/storman)
```

For UNIX Korn and Bourne shell, ensure the following man page directories are added to variable MANPATH:

```
MANPATH=$MANPATH:/usr/storapi/man:/usr/storapi/storman  
export MANPATH
```

### Windows

For Windows, the manual pages are located, by default, in the following directories:

```
C:\Program Files\EMC\SYMCLI\man
```

```
C:\Program Files\EMC\SYMCLI\storman
```

To open a file, double-click it and select **NotePad** from the **Open With** dialog box.

**Note:** In Windows 2008 R2, double-clicking opens these files in WordPad by default.

## OpenVMS

For OpenVMS, you can view help pages with the DCL utility SYMHELP.

# Managing database and gatekeeper locking

Within a SYMCLI session, gatekeeper and database locks are used to avoid conflicts in accessing a VMAX array by way of gatekeepers or the configuration database.

## Semaphore requirements on UNIX

You do not need to modify semaphore settings on the host when using its default configuration (default options). However, some settings (for example, in the `daemon_options` file) will lead to semaphore allocation. In which case, you should configure the UNIX kernel to meet the SYMCLI semaphore requirements as follows:

- ◆ One semaphore ID for each VMAX gatekeeper device.  
The number of system-wide semaphores is specified by the UNIX kernel parameter `semms`, or its equivalent.
- ◆ A minimum of three semaphores per semaphore set.  
The maximum number of semaphores per semaphore set is specified by the UNIX kernel parameter `semms1`, or its equivalent.
- ◆ A minimum of three operations per `semop` call.  
The maximum number of operations per `semop` call is specified by the parameter `semopn`, or its equivalent.

See [“Setting the optional base daemon behavior parameters” on page 123](#) for more information.

These requirements are usually within the bounds of the default semaphore parameter settings on a UNIX system. However, for information about maximizing these parameters on your specific platform, refer to [Appendix D](#).

## Meeting semaphore requirements

If the requirements are not within the bounds of the default semaphore parameter settings on a UNIX system, the UNIX kernel must be reconfigured. If the UNIX kernel is not reconfigured, the SYMCLI gatekeeper locking may fail. For more information about adjusting semaphore parameters for your operating system, refer to [Appendix D](#).

## Refreshing the semaphores

After you have reconfigured the UNIX kernel, you may need to reboot the UNIX system to refresh the kernel semaphore structures.

You can use the following UNIX command to view the currently allocated system semaphores:

```
ipcs -s
```

## De-allocating semaphores

If you exceed the maximum number of semaphores allocated, you may need to de-allocate system semaphores in order to obtain more semaphores.

To de-allocate a system semaphore, use the following UNIX command:

```
ipcrm -s IpCID
```

## Windows locking

On Windows, SYMCLI allocates named mutexes to accomplish locking. These mutexes are automatically de-allocated from the system when the last thread which has opened the mutex finishes accessing the mutex, or is terminated. There is no mutex kernel configuration requirement. The mutex name is derived from the gatekeeper pathname.

## Avoidance and selection files

The following optional files can exist in the SYMAPI configuration directory<sup>1</sup>, and limit the scope or change the performance of SYMCLI online commands, particularly, `symcfg discover` and `syminq`:

- ◆ gkavoid
- ◆ gkselect
- ◆ inqfile
- ◆ symavoid

---

**Note:** These files and the following text are for experienced SYMCLI or SYMAPI users and are not a prerequisite for normal use.

---

These files can be used to customize and streamline command line coding to your specific environment.

**Be sure to delete these files when they are no longer needed as they can cause unexpected behavior and command limitations.**

---

## Editing and file format

These are editable files with device names or array IDs you can use to limit SYMCLI or SYMAPI from seeing certain VMAX arrays, devices, or gatekeepers which would otherwise be affected by various commands.

The files hold either physical device names (*PdevNames*) or array IDs (*Symmids*) with line entries having only one device name or ID per line. Lines beginning with a “#” (comment) are ignored by SYMCLI.

---

1. The location of this directory varies according to the operating system. For more information, refer to [Appendix E](#).

## gkavoid and gkselect

The `gkavoid` and `gkselect` files affect calls to various online SYMCLI commands that use a gatekeeper to communicate with a VMAX array.

**Note:** For more information on using these files, refer to [“Using the gkavoid and gkselect files” on page 209](#).

## inqfile

The `inqfile` file configures calls to `syminq` and `symcfg discover` to find only the PdevNames specified in this file. This can be useful if you want to limit the command(s) to view only certain devices from your host. The inquiry file is formatted with physical (host) device names with one PdevName per line.

[Table 23](#) provides platform specific PdevName examples.

**Table 23** PdevName examples

Operating system	Example Pdevname
UNIX	/dev/rdisk/c2t0d2s2
Windows	\\.\PHYSICALDRIVE1
z/OS	VOL001

**Note:** For more information on PdevNames, refer to the *EMC Solutions Enabler Array Management CLI User Guide*.

## symavoid

The `symavoid` file affects the operation of `symcfg discover` so that it does not look for devices that belong to the arrays specified in this file. This may be useful if there are multiple VMAX arrays connected to the host that you want SYMCLI to avoid. The array avoidance file is formatted with 12-character array IDs with one ID per line.

To obtain a list of array IDs, enter:

```
syminq -symmids
```

## Changing the default behavior of SYMCLI

The `options` file (initially installed as `README.options`) in the SYMAPI configuration directory contains behavior parameters that can be set to critically change the default behavior of SYMCLI operations, SYMAPI calls, and their control actions. It can be used to impart certain global restrictions as well as customize and streamline command line coding to your specific environment.

**CAUTION**

This file and the text in this chapter are for experienced SYMCLI or SYMAPI users and are not a prerequisite for normal use. Improper adjustment of these parameters can impose unwanted restriction of features or possibly render your VMAX environment inoperative.

The `options` file must be created and placed in the SYMAPI configuration directory.<sup>1</sup>

## Editing the options file

Once this file is created, you can edit it to change the default behavior of certain SYMCLI or SYMAPI command options. The file contains editable parameters to set certain optional defaults in the line entries. SYMAPI ignores lines beginning with a “#” (comment).

## Removing default options

To remove a default option, remove the line entry, rename the file, or comment the line by adding a pound (#) sign at the beginning of the line entry.

## Options file parameters

For `options` file parameter descriptions, refer to *EMC Solutions Enabler SYMCLI Command Reference Guide*.

## Oracle multiple instances through a remote server

If you are using Storage Resource Management (SRM) and intend to perform database mapping calls from your host to a remote server that has more than one Oracle instance, you must complete the following procedure:

1. With the remote SYMAPI service stopped, set the remote server UNIX environment variables `ORACLE_HOME` and `ORACLE_SID` for the system requirements. When set, re-start `storsrvd`.
2. Configure Oracle SQL\*Net (V7) or Net8 to include other instance names (TNS names) in a network service.  
The TNS names are located in the `$ORACLE_HOME/network/admin/tnsnames.ora` file. The Oracle instance to which your `ORACLE_HOME` points is the only instance that must have the TNS names registered.
3. Configure the Oracle listener service for the other Oracle instances with which you need to work.
4. Test your Oracle environment for a valid configuration by running `$ORACLE_HOME/bin/sqlplus` as follows:

```
sqlplus user/passwd@service
```

where:

`user/passwd` describes your Oracle username and password.

- 
1. The location of this directory varies according to the operating system. For more information, refer to [Appendix E](#).

*service* is the TNS name you registered for the Oracle instance.

---

**Note:** For more information about configuring SQL\*Net or Net8, refer to the appropriate Oracle documentation.

---

5. Set the EMC environment variable `SYMCLI_RDB_CONNECT` to describe your user name, password, and service name with the format `usr/passwd@service` to the instance of choice.

## Client/server RDBMS environment variable behavior

The commands `symioctl` and `symrdb` scan the client's current environment variables and apply them across the client/server connection. For example, when the following is invoked from the client:

```
symrdb -type oracle list
```

`symrdb` will search for `ORACLE_HOME` and `ORACLE_SID` on the client side. If found, the variables are passed to the SYMAPI server and used with subsequent database mapping calls.

Set the `LD_LIBRARY_PATH` environment variable for all databases except Oracle and SQL Server.

## Setting up daemons for distributed application support

To improve performance on a number of applications or scripts running at once, you can employ Solutions Enabler daemons (services) that run in the background with root privileges to a local storage resource. Applications do not have to run as a privileged user.

The base daemon (`storapid`) coordinates all VMAX array locks and parallel application syscalls to your operating system kernel, which optimizes their operations (such as TimeFinder-type actions).

For SRM applications, there are a number of vendor-specific database daemons available to improve the speed of database access or mapping operation. SRM database performance is improved by using a persistent database connection, a fast communication mechanism, and parallel operations. For SRM, a single database daemon can support connections to multiple instances/databases. In addition, there is also an SRM daemon (`storsrmd` and `storsrmd64`) that allows non-root users and non-administrators to perform certain SRM operations.

When your host is locally-connected to the VMAX array, applications and daemons must reside in that host. However, for client/server systems, the storage management applications reside in the client, and most of the daemons must reside in the SYMAPI server. The one exception to this is the event daemon, which runs on both the client and server.

Table 24 lists the available daemons. Additional information is contained in the specific documentation for each. Note that on certain platforms, only some of these daemons are supported.

**Table 24** Daemon support matrix

Daemon name	Platforms supported	Description	Daemon-specific parameter documentation
storapid	UNIX <sup>a</sup> , Win64, z/OS, AS400	Base daemon	Refer to <a href="#">“Managing the base daemon” on page 122</a> in this guide.
storgnsd	UNIX, Win64, z/OS, AS400	Group Name Services (GNS) daemon	<i>EMC Solutions Enabler Array Management CLI User Guide</i>
storrdfd	UNIX, Win64	RDF daemon	<i>EMC Solutions Enabler SRDF Family CLI User Guide</i>
storevntd	UNIX, Win64, z/OS	Event daemon	Refer to <a href="#">“Setting up the event daemon for monitoring” on page 124</a> in this guide.
storsrvd	UNIX, Win64, z/OS, AS400	SYMAPI Server daemon (executes remote Solutions Enabler API functions)	Refer to <a href="#">Chapter 4</a> in this guide.
storwatchd	UNIX	UNIX only: Watchdog daemon	<i>EMC Solutions Enabler Array Management CLI User Guide</i>
storsrmd storsrmd64	Solaris, AIX, HP-UX, Windows	SRM daemon	<i>EMC Solutions Enabler Symmetrix Storage Resource Management CLI Product Guide</i>
storstpd	UNIX, Win64	Statistics (STP) daemon	
stororad		SRM daemon for Oracle DB	
storudbd		SRM daemon for UDB DB	
storsqld		SRM daemon for SQL DB	
storsybs12d		SRM daemon for Sybase DB - version 12	
storsybs12.5d		SRM daemon for Sybase DB - version 12.5	
storsybs12.5_64d		SRM daemon for Sybase DB - version 12.5 (64-bit)	

a. UNIX represents Sun, AIX, HP-UX, and Linux systems.

For information on using daemons, refer to the remainder of this chapter.

## Starting daemons

Most daemons are automatically started as their services are required. For example, `storgnsd` is automatically started the first time a group operation is performed.

However, in situations where you need to manually start a daemon, you can use the following command:

```
stord daemon start DaemonName [-wait Seconds]
```

By default, the `stordaeomon` command waits 30 seconds to verify that the daemon is running. To override this, use the `-wait` option. For example, to start an SRM daemon for an Oracle database and wait five seconds for it to come up, enter:

```
stordaeomon start stororad -wait 5
```

## Stopping daemons

To stop a daemon, apply the following command:

```
stordaeomon shutdown DaemonName|all [-wait Seconds]
                    [-immediate] [-abort]
```

By default, stopping a daemon causes it to no longer accept commands from client processes using its services; it does not actually exit until all client programs using its services exit first.

The `-immediate` option causes the daemon to exit regardless of whether there are still client programs connected to it.

The `-abort` option sends a KILL signal, instead of asking the specified daemon to shut itself down. Only privileged users (root) can use this option. (Supported on UNIX only.)

## Viewing daemons

To view what daemons are present, enter either of the following:

```
stordaeomon list [-running] [-all] [-v]
```

or

```
stordaeomon show DaemonName
```

For the database daemons, an instance identifier is appended to the daemon name. For example, a `stororad` daemon started with the instance name `ords` would display as `stororadords`.

## Setting daemons to auto-start on boot

To set a daemon to automatically start upon reboot of your system, enter the following:

```
stordaeomon install DaemonName -autostart
```

## Authorizing daemon connections

Typically, daemons run with root/administrator privileges, which enable them to handle the tasks required by SYMCLI commands (and any SYMAPI call) that require privileged access. This enables non-privileged users to run the SYMAPI application.

For example, when a SYMAPI call attempts to open a gatekeeper (which requires a privileged user), the request is actually passed to the base daemon process, which will open the gatekeeper device. If you were to run a process level debugger, such as `adb` on the Sun OS platform, and check the per-process file table, the open gatekeeper would appear in the base daemon process, not in the user process. From this point on, the transfer CDB requests are passed to the base daemon since it is the process that opened the gatekeeper.<sup>1</sup>

By default, the daemons only accept connection requests from users running with root or administrator privileges. For non-root users to use this feature, you need to create a `daemon_users` file (initially installed as `README.daemon_users`) with a list of allowed usernames.

The `daemon_users` file is an editable template file installed in the SYMAPI configuration directory.<sup>1</sup>

Using a text editor, a System Administrator can add entries to this file using the following formats:

<code>smith storapid</code>	Local user smith is authorized to use the <code>storapid</code> daemon.
<code>ENG/smith storapid</code>	Windows local user smith in the ENG domain is authorized to use the <code>storapid</code> daemon.
<code>smith storora*</code>	The * is a wildcard. Local user smith is authorized to use any daemon whose name begins with <code>storora</code> . For example, the SRM Oracle DB daemons.
<code>smith stororad freeze,...</code>	Local user smith is authorized to perform freeze and thaw operations via the <code>stororad</code> daemon. The third column consists of a comma separated list of operations that the user is authorized to perform. Valid values are: <ul style="list-style-type: none"> <li>• <code>freeze</code>: The user is authorized to perform DB freeze and thaw operations.</li> <li>• <code>startup_instance</code>: The user is authorized to start a DB instance.</li> <li>• <code>shutdown_instance</code>: The user is authorized to shutdown a DB instance.</li> </ul>

---

**Note:** There is no reason to add privileged users to this file, as they are automatically authorized.

---

---

**Note:** For more information, refer to the `daemon_users` file.

---

## Controlling daemon behavior

The `daemon_options` file (initially installed as `README.daemon_options`) contains parameters to control the behavior of the various Solutions Enabler daemons. As each daemon starts, it reads this file and applies all applicable settings.

- 
1. All daemons except for `storapid` the Base daemon may be configured to run as a non-root user in Unix. For details on considerations and configuration instructions, refer to the *EMC VMAX Family Security Configuration Guide*.
  1. The location of this directory varies according to the operating system. For more information, refer to [Appendix E](#).

**⚠ CAUTION**

These parameters are intended for experienced Solutions Enabler users. In most cases, the daemon default settings will be sufficient.

The `daemon_options` file is an editable template file located in the SYMAPI configuration directory.<sup>1</sup>

Using a text editor, a system administrator can add lines to this file using either of the following formats:

<code>NAME = VALUE</code>	Sets the parameter <code>NAME</code> for all daemons that understand this parameter.
<code>stororad:NAME = VALUE</code>	Sets the parameter <code>NAME</code> for only the <code>stororad</code> daemon.
<code>storora*:NAME = VALUE</code>	Sets the parameter <code>NAME</code> for all daemons whose name begins with <code>storora</code> . The <code>*</code> is a wildcard that can be used to match the remainder of a daemon's name.

**Note:** For more information, refer to the `daemon_options` file.

## Controlling daemon logging

All Solutions Enabler daemons use a consistent infrastructure for logging events, which you can customize using the general logging options in the `daemon_options` file (Table 25). In addition, the `daemon_options` file also includes daemon-specific options that allow you to further customize logging for a particular daemon (for example, `storevntd` and `storsrvd`).

By default, each daemon records its log data in a pair of files (`daemon_name.log0` and `daemon_name.log1`) in the Solutions Enabler logging directory. Using this method, the daemons will alternate logging from one file to the other as they become full.

Optionally, you can configure each daemon to record its logs to a dated log file in the form `daemon_name-yyyymmdd.log`. Using this method, each daemon will begin recording to a newly dated log file on the first write after 12 A.M.

---

1. The location of this directory varies according to the operating system. For more information, refer to [Appendix E](#).

Table 25 shows the general logging configuration options you can use to customize the Solutions Enabler daemon log files. For details on the syntax and values, refer to the `<SYMAPI_HOME>/config/daemon_options` file installed in the configuration directory.

**Table 25** General logging configuration options in the `daemon_options` file

Option	Description
<code>logfile_type</code>	Controls file switching strategy. Possible values are WRAP or DATED.
<code>logfile_size</code>	Used for wrapping log files, this option specifies the maximum number of KBs to write before a switch to the other file of the pair.
<code>logfile_retention</code>	Used for dated log files, this option indicates how many days to retain old log files.
<code>logfile_perms</code>	Specifies the permissions on any newly created log files.

For logging configuration options specific to the event daemon, refer to [“Setting up the event daemon for monitoring” on page 124](#), and for options specific to the SYMAPI server daemon, refer to [“Specifying server behavior” on page 163](#).

## Managing the base daemon

The base daemon (`storapid`) provides centralized gatekeeper device management for all Solutions Enabler applications requiring access to VMAX arrays, along with the GNS and RDF daemons. This alleviates contention when there are limited gatekeeper resources available and also eliminates the need for every client to constantly select, open, lock, and ping for an available gatekeeper device for every online function.

Additionally, the base daemon monitors Symmetrix External Locks (SEL) and Device External Locks (DEL), and automatically releases any SELs and DELs (except for persistent DELs) when an application (normally or abnormally) exits. The base daemon also eliminates the need for Solutions Enabler applications to run as root.

---

**Note:** For more on gatekeepers, refer to [Chapter 7](#).

---

## Starting the base daemon

By default, the base daemon will automatically start the first time a Solutions Enabler application attempts to access a VMAX array. In addition, you can use either of the following methods to start the base daemon:

- ◆ Manually start the daemon via the `stordaeomon` command line utility as follows:

```
stordaeomon start storapid [-wait Seconds]
```

---

**Note:** For more information on this command, refer to [“Starting daemons” on page 118](#).

---

- ◆ Set the base daemon to automatically start every time the local host is booted using the following command:

```
stordaeomon install storapid -autostart
```

---

**Note:** `storapid` is installed with the `-autostart` option set by default.

---

Manually pre-starting the daemon will eliminate any performance delay incurred when the base daemon needs to be started by an application the first time it tries to connect.

If the base daemon abnormally terminates, the Solutions Enabler watchdog daemon (`storwatchd`) will automatically restart it. This ensures that the base daemon is always running.

## Stopping the base daemon

To stop the base daemon, use the following command:

```
stordaemon shutdown storapid | all [-wait Seconds] [-immediate]
[-abort]
```

Specifying `all` as the `DaemonName` will stop all of the daemons currently running.

If there are applications with connections to the base daemon, you can use the `-immediate` option to shut it down immediately; otherwise, it will not shutdown until the applications are done using it.

The `-abort` option sends a KILL signal, instead of asking the base daemon to shut itself down. Only privileged users (root) can use this option. (Supported on UNIX only.)

## Setting the optional base daemon behavior parameters

The `daemon_options` file contains a set of parameters that can be modified to affect base daemon behavior. The file contains editable behavior parameters set to certain optional defaults in the line entries. Commented lines beginning with a pound sign (#) are ignored.

To remove any parameter option, remove the line entry, rename the file, or comment the line by adding a pound sign (#) at the beginning of the line entry.

Table 26 lists some of the possible optional base daemon parameters.

**Table 26** Base daemon optional behavior parameters<sup>a</sup>

Parameter	= <OptValue   defaultvalue>	Description
storapid:inquiry_timeout	0 - nn, -1   900	Specifies how long (in seconds) inquiry results are to remain in cache before expiring, and new data retrieved from the host and array. A value of -1 indicates the data <i>never</i> expires. A value of zero indicates the data <i>always</i> expires.
storapid:gk_use	dedicated_only   legacy	Specifies whether the base daemon is restricted to only using dedicated gatekeeper devices when making syscalls. dedicated_only restricts the base daemon to only dedicated gatekeepers. legacy allows the base daemon to use non-dedicated gatekeeper devices.
storapid:use_all_gks	disabled   enabled	Specifies whether the base daemon is free to use all available gatekeeper candidates. disabled restricts the base daemon to using only 75% of the available gatekeeper candidates. This option locks the gatekeeper with a host-based lock, such as a semaphore or mutex. enabled allows the base daemon to use all available gatekeeper candidates. This option locks the gatekeeper with an internal locking mechanism. If you are running InfoMover, you must set this option to disabled.

a. For more information on the available parameters, refer to the `daemon_options` file.

## Setting up the event daemon for monitoring

The Solutions Enabler event daemon (`storevntd`) acts as a clearinghouse for events, also known as alerts, on a host. It supports two modes of operation. This section concentrates on the second mode of operation.

- ◆ Under the first mode, applications register for events (an event is defined by one or more conditions) in which they are interested through Solutions Enabler API calls. These requests are forwarded to the event daemon which then begins to watch for the conditions of interest. When an event is detected, it triggers an asynchronous callback to the application.

Clients such as Unisphere for VMAX and SMI Provider all make use of this mechanism.

- ◆ Under the second mode, the event daemon actively watches for conditions of interest — independently of any applications. Options settings (described in [“Configuring event logging” on page 128](#)) specify the events for which the daemon should monitor and how it should log them when they occur. Possible logging options are:
  - file: record to a file on disk.
  - system: record through the logging service provided by the host operating system. On UNIX-like systems, this is the local syslog service. On Windows, this is the Windows event log.

- **syslog:** use the syslog wire protocol to forward event records to a remote syslog server, that is, an RSA enVision server.
- **snmp:** forward event records to a remote SNMP listener. Solutions Enabler only supports SNMP version 1 traps.

---

**Note:** Only events for VMAX arrays are supported in this mode.

---

## Event sources

The events daemon monitors for events from the following sources:

- ◆ Events that are directly generated by a storage array, and are merely routed by the event daemon to interested parties.
- ◆ Events manufactured by the event daemon by periodically polling the storage array and tracking various conditions. For example, an event tied to the overall utilization (as a percentage) of a Snap pool.
- ◆ Events that are generated by a different process entirely, and are forwarded to the event daemon to be routed to any interested parties. For example, the GNS (storgnsd) and Base (storapid) daemons both generate events that applications can register to receive
- ◆ The event daemon can also be directed to map records from the Audit log into events.
- ◆ Non-array events raised by applications such as Unisphere for VMAX.

Events, when delivered, contain a number of pieces of information including, but not limited to, the following:

- ◆ The entity to which the event relates. This will usually be an array ID.
- ◆ The sub-component to which the event relates, when there is one. The following is a list of the most relevant sub-components.
  - A device number as a 4-digit hexadecimal number, for example, 0007 or 0123.
  - A disk ID using the standard Solutions Enabler syntax, for example, 16B:C2.
  - A director ID using the standard Solutions Enabler syntax, for example, FA-3B.
  - A port on a director, for example, SA-03C:2.
  - A Snap, DSE, or thin pool using the pool name, for example, finance or cambridge.
- ◆ The identifier of the event corresponding to the SYMAPI\_AEVENT2\_UID\_T enumeration found in the `symapi.h` header file that is shipped with the SDK.
- ◆ A severity level. Possible values are: NORMAL, INFO, WARNING, MINOR, MAJOR, FATAL, and CRITICAL. The NORMAL severity is relevant to threshold events described in the next section.
- ◆ The date/time that the event was generated.
- ◆ For certain events, a numerical value, which is used to determine the severity of the events. This concept is described in the following section.
- ◆ A description of the event along with some auxiliary textual data.

## Threshold events

Certain events are associated with a numeric value. This value is compared with a set of threshold values, which determine whether the event is delivered and, if so, with what severity. These events are known as threshold events. Each threshold event has a set of default threshold filters defined for it.

For example, the SYMAPI\_AEVENT2\_UID\_THRESH\_POOL\_FREESPACE event tracks as a percentage (0% - 100%) the space utilization within DSE, Snap and thin pools and has the following default threshold filters defined:

- If value is 100%, deliver event with FATAL severity
- If value is  $\geq$  80%, deliver event with CRITICAL severity
- If value is  $\geq$  70%, deliver event with MAJOR severity
- If value is  $\geq$  65%, deliver event with MINOR severity
- If value is  $\geq$  60%, deliver event with WARNING severity

When registering for events, you can specify a custom filter to replace the default one for that event. Each filter contains a set of rules composed of:

- A comparison function: either  $\geq$  or  $\leq$ .
- A number (integer) to compare the event value against.
- A severity to deliver the event with - if the comparison succeeds.

These threshold filters define bands of event value. Events are generated as the value crosses from one band to another. For the thresholds in the earlier example, a pool's utilization that rose gradually from 60% to 92% and then dropped back to 50% again would result in delivery of the following events:

```
WARNING severity when the value passes 60%
MINOR   severity when the value passes 65%
MAJOR   severity when the value passes 70%
CRITICAL severity when the value passes 80%
MAJOR   severity when the value drops below 80%
MINOR   severity when the value drops below 70%
WARNING severity when the value drops below 65%
NORMAL  severity when the value drops below 60%
```

If an event's value crosses into a range that does not match any of the configured thresholds, the event daemon will automatically deliver an event with a severity of NORMAL to indicate that it no longer falls into one of the defined threshold bands. In essence, NORMAL should serve as an "all-OK" indicator.

There is never a reason to explicitly specify a threshold for the NORMAL severity. It should cover everything that is not explicitly matched.

---

**Note:** Many of the threshold events that indicate a percentage will only trigger at increments of 5%.

---

If the supplied threshold list has only a single filter that performs a comparison against zero, the event daemon will deliver an event every time the event value changes. For example, specifying the following filter:

```
"If value >= 0 : WARNING"
```

will deliver an event with WARNING severity every time the value changes.

## Starting the event daemon

By default, the event daemon will automatically start the first time a Solutions Enabler application requires its services. However, you can also manually start the event daemon via the `stordaeomon` command line utility as follows:

```
stordaeomon start storevntd [-wait Seconds]
```

---

**Note:** For more information on this command, refer to [“Starting daemons” on page 118](#).

---

In addition, you can also set the daemon to automatically start every time the local host is booted using the following command:

```
stordaeomon install storevntd -autostart
```

---

**Note:** Configure the daemon to automatically start at system boot when you will be using it to log events to a Syslog, Event log, SNMP, or file on disk.

---

## Reloading the daemon\_options settings

To reload the event daemon settings, run the following command:

```
stordaeomon action storevntd -cmd reload
```

Issuing the `reload` command causes the daemon to re-read the contents of the `daemon_options` file.

## Listing supported event categories

To view a list of event categories currently supported by a running event daemon:

1. Run the following command to load the array event module:

```
stordaeomon action storevntd -cmd load_plugin Symmetrix
```

2. Run the following command to list the supported event categories:

```
stordaeomon action storevntd -cmd list -categories
```

## Stopping the event daemon

To stop the event daemon, run the following command:

```
stordaeomon shutdown storevntd [-wait Seconds]
```

---

**Note:** For more information on using the `shutdown` command, refer to [“Stopping daemons” on page 119](#).

---

## Configuring event logging

The `daemon_options` file contains a set of parameters that can be modified to affect event daemon behavior. The file contains editable behavior parameters set to certain optional defaults in the line entries. Commented lines beginning with a pound sign (#) are ignored.

To remove any parameter option, remove the line entry, rename the file, or comment the line by adding a pound sign (#) at the beginning of the line entry.

Configuring event logging involves the following steps:

1. Specify logging targets.
2. Configure an event target.
3. Specify events to log.

The remainder of this section explains `daemon_options` file settings required to complete each of these steps.

---

**Note:** Changes made to the `daemon_options` file while the daemon is running will not take effect until you issue a `stordaeomon reload` command, as described in [“Reloading the daemon\\_options settings” on page 127](#).

---

### Step 1: Specify logging targets

To specify a logging mechanism, define the following parameter in the `daemon_options` file:

```
storevntd:log_event_targets = snmp syslog system file
```

---

**Note:** You must set this parameter to one or more of the valid values; otherwise, event logging will not occur. When specifying multiple values, separate them with a space.

---

where:

`snmp` specifies to log events by way of SNMP traps. Solutions Enabler only supports SNMP version 1 traps.

`syslog` (supported on all platforms) specifies to log events to a Syslog server across the network, bypassing (if on UNIX) the local host’s Syslog service and its configuration settings.

`system` does the following depending on the operating system:

- In UNIX, it specifies to log events to local host’s Syslog services. The Syslog’s configuration settings control where it directs the message.
- In Windows, it specifies to log events to the Windows Event Log.

`file` specifies to log events to a file on disk.

For example:

```
storevntd:log_event_targets = snmp system
```

## Step 2: Configure an event target

To configure an event target, do the following based on the logging mechanism you specified in “[Step 1: Specify logging targets](#)” above:

- ◆ If you specified to log events by way of SNMP (`snmp` option), complete “[Step 2A: Configure an SNMP event target](#)” on page 129.
- ◆ If you specified to log events in a log file (`file` option), continue with “[Step 2B: Configure a log file](#)” on page 131.
- ◆ If you specified to log events to the Syslog server across the network (`syslog` option), continue with “[Step 2C: Configure a Syslog target](#)” on page 132.
- ◆ If you specified to log events to Syslog or the Windows Event Log, (`system` option), you do not have to configure an event target. In this case, you should continue with “[Step 3: Specifying events to log](#)” on page 132.

### Step 2A: Configure an SNMP event target

The event daemon provides the necessary SNMP MIB support and trap generation services required to monitor the status of VMAX storage environments from third-party enterprise management frameworks.

The event daemon includes a loadable SNMP library which, once enabled and configured in the `daemon_options` file, acts as a self contained SNMP agent. It is responsible for maintaining internal Fibre Alliance MIB (V3.0) tables, responding to SNMP browse requests, and generating traps in response to events.

For an application to receive SNMP trap information from the event daemon, you must specify it as a trap target by defining the following parameter in the `daemon_options` file:

```
storevntd:snmp_trap_client_registration = IP,Port,Filter,State
```

where:

*IP* is the application’s IP address.

*Port* is the port on which the application will be listening for the trap. The default port is 162.

*Filter* is the trap filtering severity level as defined in the FC-management MIB. The application will only receive traps of the specified severity level (or lesser). The default value is 10 (Mark), which means that all events are delivered.

[Table 27](#) maps the event daemon severity level to the SNMP severity levels, as specified in the FC-management MIB.

**Table 27** Event daemon severity level/SNMP severity level mappings (page 1 of 2)

Event daemon severity	SNMP trap severity
fatal	2 (Emergency)
critical	4 (Critical)
major	5 (Error)
minor	5 (Error)
warning	6 (Warning)

**Table 27** Event daemon severity level/SNMP severity level mappings (page 2 of 2)

Event daemon severity	SNMP trap severity
info	8 (Info)
normal	8 (Info)
--	10 (Mark)

*State* is the start up row state in the trap\_client\_registration table in the FC-management MIB. Possible values are ACTIVE and INACTIVE.

Multiple entries can be on the same line, separated by a blank space. In addition, they can be on their own line, delineated with a backslash (\) character on the preceding line.

For example, the following registration file specifies that the daemon will only send SNMP traps to the indicated clients when it detects an event of a severity level less than or equal to 5 (that is, Error, Critical, Emergency). The daemon will ignore events with a severity level greater than 5:

```
storevntd:snmp_trap_client_registration = 10.2.12.30,162,5,ACTIVE \
12.250.130.200,162,5,ACTIVE
```

## Step 2B: Configure a log file

The `daemon_options` file contains parameters (Table 28) that allow you to configure the log file.

The target log file is not actually opened (or created, if necessary) until the event daemon actually has an event to log. Depending on the events it is monitoring, this may not be until long after it starts.

**Table 28** Event log file configuration options

Parameter	= <OptValue   defaultvalue>	Description
storevntd:log_event_file_name	<i>LogEventFileName</i>   events	Specifies the base name of the event log files, which can also include the full pathname. This file is created in the standard Solutions Enabler log directory. For UNIX, the directory is: <code>/var/symapi/log</code> For Windows, the directory is: <code>c:\Program Files\EMC\SYMAPI\log</code>
storevntd:log_event_file_type	dated   wrap	Specifies the type of file to use. <code>dated</code> specifies that a new event log file should be created each day, with the name <code>xxxx-YYYYMMDD.log</code> . Where <code>xxxx</code> is the <i>LogEventFileName</i> . <code>wrap</code> specifies that event logging will alternate between two files ( <code>xxxx.log0</code> and <code>xxxx.log1</code> ) - switching from one to the other when it reaches its maximum size, as specified in the <code>log_event_file_size</code> parameter. By default, a single file will be used.
storevntd:log_event_file_size	> 0 - <i>nn</i>   1	When used with the <code>log_event_file_type</code> parameter set to <code>wrap</code> , this parameter specifies the maximum file size (in KB) allowed before wrapping to the alternate file. This value should be a decimal number greater than zero. <b>Note:</b> The maximum value for the <code>log_event_file_size</code> is 2097152 KB.
storevntd:log_event_file_retention	> 0 - <i>nn</i>   3	When used with the <code>log_event_file_type</code> parameter set to <code>dated</code> , this parameter specifies the number of days to retain the log files. This value should be a decimal number greater than zero.
storevntd:log_event_file_perms	rw, n   r	Specifies the permissions for the event log files. <code>rw</code> specifies that anyone can read or write to the files. <code>r</code> specifies that anyone can read the files, but only the root/administrator (or whatever identity the event daemon is running as) can write to the files. <code>n</code> specifies that only the root/administrator (or whatever identity the event daemon is running as) can read and write to the files.

## Step 2C: Configure a Syslog target

The `daemon_options` file contains parameters (Table 29) that allow you to configure a Syslog target.

**Table 29** Event log file configuration options

Parameter	= <OptValue   defaultvalue>	Description
<code>storevntd:log_event_syslog_host</code>	<i>SyslogHostName</i>	Specifies the name of the host on which the Syslog server is running. This value must be supplied.
<code>storevntd:log_event_syslog_port</code>	<i>nnn</i>   514	Specifies the port on which the server is listening.

## Step 3: Specifying events to log

Solutions Enabler provides the ability to capture both array events and non-array events from certain application to log files. This is accomplished by building event lists, which is a mechanism for specifying the types of events for which to generate traps. These event lists are defined in the `daemon_options` file.

### Array events

To build an array event list, define the following parameter in the `daemon_options` file:

**Note:** Many array events are organized into categories. These categories are hierarchical in that a category can contain individual events, as well as other categories.

```
storevntd:log_symmetrix_events = [sid=SymmID,]
UID|Category ... [,sev=SEV] [,tgt=TGT] [,comp=COMP]
[,comp_type=CPMP_TYPE] [thresh_critical=Percent,
thresh_maj=Percent, thresh_warn=Percent, thresh_info=Percent,
thresh=Percent] [,ignore]
```

where:

**sid** — Specifies the 12-digit ID of the VMAX array to which the record applies. You must specify the full SID (12 digits). If this field is missing, the registration applies to all local and remote VMAX arrays.

**UID** — The numerical event UID value.

**Category** — One or more of the following event categories, separated with a comma:

- For events in the 1150 - 1199 range:
  - events (all events in this category)
  - array subsystem
  - checksum
  - diagnostic
  - environmental
  - device pool
  - service processor
  - srdf system
  - srdf link
  - srdf session
  - srdf consistency group
  - director

- device
- disk
- For events in the 1200 - 1999 range:
  - status (general component state change)
  - optimizer (Optimizer/FAST related)
  - groups (Group (DG/CG) related)

---

**Note:** Each of the event categories may contain numerous individual events, as shown in [Appendix B](#).

---

**sev** — Specifies the minimum severity level for which events should be logged. All events with a severity level at or above the specified severity will be logged. Take care when setting this option. Possible values are:

- normal
- info
- warning
- minor
- major
- critical
- fatal

**tgt** — Specifies the target to which the daemon should log the events. Possible values are: snmp, syslog, system, and file.

The value you specify for *TGT* must match one of the values you specified in the `log_event_targets` parameter; otherwise, the daemon will not log events for this record.

The target you specify here will override the global `log_event_targets` setting described in “[Step 1: Specify logging targets](#)” on page 128.

**comp** — Specifies the specific subcomponent for which you want to log events. For example, a particular device, disk, pool, etc. When you specify a value for this field, the event daemon will only log events for the specified component. You can either specify a single component or a comma separated list of components. If the latter, you must enclose the list with double quotes.

For example:

<code>comp=0100</code>	a single device
<code>“comp=0100,0200,030”</code>	multiple devices
<code>“comp=finance,sales”</code>	multiple pools

**compnt\_type** — Specifies a type of component. When present, only events for the specified component type are delivered. If omitted, events for any component type are delivered. This is most useful for events that can be delivered against multiple types

of components. An example is the Pool Status events, which can be generated for DSE, Thin or Snap Pools. Possible values are: device, disk, director, port, dsepool, tpdatapool, snappool, dg, cg, sg, srdf-grp and migrsess.

<code>thresh_critical=Percent</code>	Specifies the threshold level at which the daemon delivers an event and at what severity it is delivered.
<code>thresh_maj=Percent</code>	This setting overrides the default threshold levels for an event. These parameters are only used when specifying threshold type events.
<code>thresh_warn=Percent</code>	
<code>thresh_inf=Percent</code>	
<code>thresh=Percent</code>	Only a subset of the full threshold functionality described in <a href="#">“Threshold events” on page 126</a> is supported. The MINOR and FATAL severities cannot be specified and a >= comparison is assumed.

The `thresh=nnn` setting is an alias for `thresh_maj`.

**ignore** — Indicates that events matched by this record are not to be delivered, even if they are matched by some other record. The order of records doesn't matter. If an event is matched by any record with the ignore parameter, it will be ignored.

Only a single `log_symmetrix_events` option can be present. Since this can become quite long, it can be spread across multiple lines in the file via the use of '\ ' continuation characters at the end of a line.

---

**Note:** The comment character (#) has no effect if it follows a line with the continuation character (/).

---

## Non-array events

To build a non-array event list, define the following parameter in the `daemon_options` file:

```
storevntd:log_app_events = [appid=appid,] CAT[category,]
[comp=COMP,] [comp_type=COMP_TYPE,] [,tgt=TGT]
```

where:

**appid** — Specifies an application id. By default, all application events will be monitored.

**CAT** — Specifies event(s) to be monitored. This can be either the name of an event category or a numerical event ID. This is the only field that is required. One or more values (comma separated) may be present. The Supported categories are: SMC and SPA.

**comp** — Certain events apply to specific sub-components within the application. This field specifies that only events for the specified component (or components) should be delivered. If more than one component is present, the entire field must be enclosed in double quotes.

For example:

<code>comp=name</code>	a single component
<code>“comp=name1,name2,name3”</code>	multiple components

**comp\_type** — Specifies events to be monitored. This must be one or more of the predefined types. The supported component types are: *univmax*, *univspa*, *univspv*, *jboss*, and *dbms*.

**tgt** — Specifies the target to which the daemon should log the events. Possible values are: *snmp*, *syslog*, *system*, and *file*.

The value you specify for *TGT* must match one of the values you specified in the *log\_event\_targets* parameter; otherwise, the daemon will not log events for this record.

The target you specify here will override the global *log\_event\_targets* setting described in “[Step 1: Specify logging targets](#)” on page 128.

An example with 4 records or separate registrations is as follows:

```
storevntd:log_event_targets = syslog file

storevntd:log_symmetrix_events = \
  sid=000192600356, 1200,1201,1202 ;\
  sid=000192600357, "comp=0001,0002,0003",1204,1205 ;\
  1212,1213, thresh_major=60, thresh_warning=50, thresh_info=30 ;\
  tgt=file, sid=000194900123, status
```

## Event output examples

The following examples illustrate the format of the various event outputs. For a more detailed description of the event formats, refer to “[Event message formats](#)” on page 136.

In these examples:

- ◆ *symid:000194900123* is the event entity; normally a storage array.
- ◆ *date=xxx* corresponds to the date/time that the event was originally generated. If the date field contains a *z* suffix, the date is in UTC time, otherwise, it is local time. If the example contains a second date field, it indicates when the logging service (for example, Syslog) posted the event.

### Log file

The following example illustrates the format of an event as reported in a log file (target = file):

```
[evtid=1200] [date=2010-12-22T09:08:17] [symid=000194900123]
  [Device=0010] [sev=normal] = Device state has changed to Offline.
```

### Syslog service (local UNIX host)

The following example illustrates the format of an event as reported by Syslog service on a local UNIX host (target = system).

Note that the italicized text was generated by local Syslog service. In this case, a Solaris host:

```
Dec 22 09:08:17 182ab139 storevntd[14505]:
  [ID 989319 user.info] [evtid=1200] [date=2010-12-22T09:08:17]
  [symid=000194900123] [Device=0010] [sev=normal] = Device state has
  changed to Offline.
```

## Syslog service (different system)

The following example illustrates the format of an event as reported to a Syslog service on a different host (target = syslog):

```
Dec 22 09:03:01 EMCstorevntd: [evtid=1200] [date=2010-12-22T04:08:17Z]
[symid=000194900123] [Device=0010] [sev=normal] = Device state has
changed to Offline.
```

## Windows event log

The following example illustrates the format of an event as reported in a Windows event log (target = system):

```
[evtid=1200] [date=2010-12-22T09:08:17] [symid=000194900123]
[Device=0010] [sev=normal] = Device state has changed to Offline.
```

## SNMP trap

SNMP traps are formatted according to the Fibre Alliance MIB (V3.0). Messages contained in a trap are the same as used with the system and file logging.

## Event message formats

As discussed in earlier, the Event Daemon can be configured to automatically log events to a number of different targets (also known as destinations):

- ◆ A disk file
- ◆ Syslog
- ◆ SNMP
- ◆ Windows Event Log or local syslog service on UNIX

These log messages consist of a destination specific portion (discussed later) and a common portion. The common portion has the following format:

```
{SDEs} = {Message}
```

*{SDEs}* — A series of Structured Data Elements, each holding a '[Name=Value]' pair of tagged data.

*{Message}* — The text associated with the event.

The *{SDEs}* and *{Message}* are separated by space, equals, space (i.e.: ' = ').

In samples found below, line breaks have been added to improve readability.

For events derived from Audit log records, the event *{Message}* may itself contain multiple new lines spanning multiple lines. There will be no new lines in the *{SDEs}*.

The number of SDEs will in general be variable. Different SDEs may be present depending on the type of event - and optional ones may be omitted.

Likewise, the position (first, second, third, ...) of specific SDEs within a message cannot be relied on - except as noted below. The following common SDEs are used within all event messages.:

[fmt=xxx]	<p>The fmt SDE specifies the format of the message - its overall type. This will always be the first SDE in the message. Currently supported formats are:</p> <p>symaudit: Events that correspond directly to records from the Audit log. These are discussed in more detail further below.</p> <p>evt: All other events generated by the Event Daemon.</p> <p>Example: [fmt=evt]</p>
[date=...]	<p>The Date/Time.</p> <p>The format of the date adheres to the Syslog Protocol: <i>yyyy-mm-ddThh:mm:ss[Z]</i></p> <p>This contains a Date (<i>yyyy=mm=dd</i>) and Time (<i>hh:mm:ss</i>), separated by a 'T'. A trailing 'Z' signifies a UTC time ... otherwise, the time is Local. Events targeted to a Syslog server (target = syslog) will include a UTC ('Z') time. Other targets will include a Local time.</p> <p>Example: [date=2007-10-30T08:06:40]</p>
[symid=....]	<p>The ID of the array that the event relates to. This SDE is optional.</p> <p>Example: [symid=000192600386]</p>

**Note:** Depending on the type of event, additional SDEs will be present as discussed in subsequent sections.

### Format for simple events

In broad terms, there are two categories of events. Events derived from Audit log records are discussed in the next section. Other events generated by the event daemon are formatted with the following SDEs:

[fmt=evt]	Format. Always be the 1st SDE.
[evtid=1234]	Event UID. Always the 2nd SDE. This gives the type of event.
[date=2007-10-30T08:06:40]	Event time stamp. Always the 3rd SDE. See above.

[symid=000192600386]	Array ID. Optional. Identifies the VMAX array that the event relates to.
[[Comp]=name]	<p>Component ID. Optional. Identifies, where it is known and meaningful, the sub-component within the array that the event relates to. The following are some of the component types that may be present:</p> <p>[Device=0030] Device          [Disk=16B:C2] Disk          [Director=FA-3B] Director          [Port=SA-03C:2] Port on a Director          [SRDF-grp=7] SRDF Group          [SnapPool=sales] Snap Save Device Pool          [DSEPool=mkt] DSE Device Pool          [TPDataPool=eng] Virtual Provisioning Device Pool          [SEL=nn] Symmetrix External Lock</p> <p>The following component types correspond to sub-modules (or enclosures) within a VMAX array. At this time, they occur with the array sub-component Environmental alert SYMAPI_AEVENT2_UID_ALERT_ARR_COMP_STATUS. The format of the component name can vary depending on the array model. As an example, one might encounter:</p> <p>"SB-1/Fan-A" or          "SB-1/MIBE-L-2A/PS-A" or          "DB-1/PS-A"</p> <p>[Power=xxxxx] Power sub-system          [Fan=xxxxxx] Fan sub-system          [LCC=xxxxx] Link Control Card          [Enclosure=xxxxx] Enclosure          [MM=xxxxx] Management Module          [IOMC=xxxxx] IO Module          [Dir=xxxxx] Director (for environmental alerts)</p>
[sev=warning]	Event Severity. Optional. Supported values are: normal, info, warning, minor, major, critical, fatal

In the future, additional SDEs may be added (for example: Process ID).

Example:

```
[fmt=evt] [evtid=1201] [date=2006-12-17T10:33:05] [symid=000000006190]
[sev=fatal] = Array state has changed to Unknown.

[fmt=evt] [evtid=1200] [date=2006-12-17T21:54:53] [symid=000000006190]
[Device=0007] [sev=major] = Device state has changed to Offline.
```

## Format for audit log records

Events derived from Audit log records are formatted differently—with an expanded set of SDEs.

Format	Description
[fmt=symaud]	Format. Always be the 1st SDE. See above.
[date=2007-10-30T08:06:40]	Event time stamp. Always the 2nd SDE. See above. This is the time that the Audit record was originally written.
[symid=000000001234]	Array ID. Always the 3rd SDE.
[orig=SE]	An indication of the originator of this audit message. Possible values are: SE Solutions Enabler (host based application) SW SymmWin (SP based) UC Array software (ucode) ' ' Empty string: Unknown
[user=H:jupiter\jones]	The user name field from an Audit record - if there is one.
[host=saturn]	The host_node name field from an Audit record - if there is one.
[actid=SE12345678ab]	The activity_id field from an Audit record - if there is one.
[appid=InternalTest]	The application_id field from an Audit record - if there is one.
[aud-cls=Security]	The audit_class field from an Audit record. This field will always be present and have a value of 'NA' if nothing better can be provided.
[aud-act=Add]	The action_code field from an Audit record. This value will always be present and have a value of '' (empty string) if nothing better can be provided.  <b>Note:</b> Parsing logic should treat this field as being optional.
[aud-num=1234]	The record_num field from an Audit record. Several formats are possible: 1234 Entire message fits in one audit record 1234,1/4 1st of 4 records in the message 1235,2/4 2nd of 4 records in the message 1236,3/4 3rd of 4 records in the message 1237,4/4 4th of 4 records in the message  <b>Note:</b> For a segmented (multiple audit record) message, each record is delivered with a different record number. These could end up interleaving with other audit messages - and appear with non-sequential record numbers.

**Example:**

```
[fmt=symaud] [date=2006-12-18T12:33:03] [symid=000000006190] [orig=SE]
[user=jupiter\jones] [host=saturn] [actid=SEba8cde5711] [appid=Internal_Test]
[aud-cls=Security] [aud-act=Add] [aud-num=74]
= The User Authorization set role operation SUCCEEDED
```

**Notes**

- ◆ This overall format is compatible with BSD Syslog (RFC 3164).  
Some extensions were motivated by the Syslog NG proposal: a simplified version of Structured Data, and the Date/Time format.
- ◆ The first step in parsing the text of an event is to search for the first '=' (space=space) in the string. Before this will be the SDEs added by the event daemon. After this will be whatever message (possibly multi-line) is associated with the event.
- ◆ We assume that SDE values cannot contain ']' characters - so these are not being escaped. To be safe, parsing logic should assume that SDEs end in a ']' (right bracket, space). The last SDE will be followed by a '= ' (space, equals, space) - with perhaps an extra space character.
- ◆ Parsers should tolerate additional white space between SDEs. Although there will be at least one space between SDEs, there may be more. Similarly, there may be additional white space before the '= ' that terminates the SDEs.
- ◆ The order of SDEs shown above, some of which are optional, will be constant. In particular, the Component SDE (difficult because of the large and growing number of component types) will, if present, directly follow the symid one.

If new SDEs are added in the future (for example: a process PID : [pid=nnn]) they will be added to the end of the list - before the "= " marker that begins the event message.

To be safe, however, parsers should if possible not rely on the order of the SDEs.

- ◆ Parsers should treat SDEs that are marked optional above as such. They may or may not be present.
- ◆ The Component ID SDE is, in particular, optional. A given event may sometimes be delivered with a this SDE and sometimes not - depending on whether a component name is known.

Similarly, a given event may be delivered with different component types. For example, the SYMAPI\_AEVENT2\_UID\_ALERT\_ARR\_COMP\_STATUS alert [event id 1244] may be raised against a component of FAN, MM, IO, POWER, etc.

**Format for msgs written to Target = File**

Event messages directed at a file on disk are written exactly as previously discussed.

*Examples:*

```
[fmt=evt] [evtid=1200] [date=2006-12-17T21:54:53] [symid=000000006190]
[Device=0007] [sev=major] = Device state has changed to Offline.

[fmt=symaud] [date=2006-12-18T12:33:03] [symid=000000006190] [orig=SE]
[user=H:jupiter\jones] [host=saturn] [actid=SEba8cde5711]
[appid=Internal_Test]
[aud-cls=Security] [aud-act=Add] [aud-num=74]
= The User Authorization set role operation SUCCEEDED
```

As noted above, the 'Message' portion of events derived from Audit Log records may contain new line characters - and span multiple lines.

One strategy for recognizing message boundaries in a log file are as follows:

- ◆ Any line that begins with a '[fmt=evt]' or '[fmt=symaud]' corresponds to a start of a new event.
- ◆ Any other lines correspond to continuations of the prior event - and should be appended to that, with a space replacing the new line that came between the two lines.

## Format for messages written to Target = Syslog

A BSD-style prefix is included with the message before it is sent to a remote Syslog server. This prefix contains the following:

```
<PRI>          Priority (syslog_facility * 8 + syslog_severity)
Dec 17 10:33:20 Local Date/Time - without a Year.

                This is the time at which the event was sent to Syslog.
EMCstorevntd   Name of application (EMC Event Daemon)
:              The Header and Tag and terminated by a ':'
```

The date SDE (when the event was generated) will be UTC for a Syslog target - with a 'Z' suffix.

In the following examples, this prefix is shown in blue.

```
<11> Dec 17 10:33:20 EMCstorevntd: [fmt=evt] [evtid=1201]
    [date=2006-12-17T10:33:05Z] [symid=000000006190] [sev=fatal]
    = Array state has changed to Unknown.

<11>Jan  5 08:39:21 EMCstorevntd: [fmt=evt] [evtid=1200]
    [date=2007-01-05T08:39:05Z] [symid=000000006190]
    [Device=0007] [sev=major] = Device state has changed to Offline.
```

### Notes:

- ◆ The Facility is LOG\_USER (1).  
The Severity will be either LOG\_CRIT (2), LOG\_ERR (3), LOG\_WARNING (4) or LOG\_INFO (6).
- ◆ These messages contain two date/time fields.  
The first ('Dec 17 10:33:20') is called for by RFC 3164 (BSD Syslog): it is the local time that the event daemon sent the event to the remote Syslog server. As shown above, day numbers that are less than 10 (for example: Jan 5) are preceded by an extra space - as called for in RFC 3164.  
The second ('[date=2006-12-17T10:33:05Z]') is the time that the event was originally generated, in NG-Syslog format. In some cases, this will be in local time ... while in others (for example: events corresponding to the Audit log) these will be in UTC time ('Z' suffix). In most cases, this timestamps will be more meaningful than the BSD one at the front of the message.
- ◆ The application name 'EMCstorevntd' can serve an indicator that this originated from the EMC Event Daemon.

- ◆ In the sample event messages that are present in subsequent sections, new lines have been added to improve readability.

### Format for messages written to Target = System (UNIX)

Messages sent to Syslog via the System Target have a prefix added by the platform syslog module - which may differ depending on the OS.

The following example was taken from a Solaris 2.8 desktop. The text in blue (before the `fmt SDE`) was added by the Solaris syslog logic.

```
Dec 17 10:33:20 182ab139 storevntd[6881]: [ID 784156 user.error] [fmt=evt]
[evtid=1201] [date=2006-12-17T10:33:05] [symid=000000006190]
[sev=fatal] = Array state has changed to Unknown.
```

#### Notes:

- ◆ The facility is LOG\_USER (1).  
The Severity will be either LOG\_CRIT, LOG\_ERR, LOG\_WARNING or LOG\_INFO.
- ◆ If syslog on the host is configured to forward across the network to a remote server (syslog.conf), the above will be prefixed by a “<PRI>” value.
- ◆ The '[6881]' field above is the process ID of the Event Daemon.
- ◆ The '[ID 784156 user.error]' field above is an extension added by Solaris. The '784156' serves as a message identifier - in this case, taken from some type of hash over the message.

### Format for messages written to Target = System (Windows)

The message itself has the same format as what was shown above - no prefix is added.

Example:

```
[fmt=evt] [evtid=1201] [date=2006-12-17T10:33:05] [symid=000000006190]
[sev=fatal] = Array state has changed to Unknown.
```

For the other attributes stored in the Windows event log:

- The Type will be ERROR, WARNING or INFORMATION.
- The Source will be storevntd.
- The Category will be Event.
- The Event ID will be 0.
- The User will be N/A.
- The Description is as shown above.

### Format for messages written to Target = SNMP

The Event Daemon encodes SNMP traps according to the Fibre Channel Alliance MIB (version 3.0). These traps contain a number of fields (identified by OID) and values. The most relevant of these are the following - along with examples of values they might have.

**SNMP trap ID (this is an integer)**

This is the internal event ID. It is incremented for each event, ranging between 1 and **connUnitMaxEvents**. The default value for **connUnitMaxEvents** is 256. It is configurable by modifying the **snmp\_event\_table\_size** value in the **daemon\_options** file.

OID: 1.3.6.1.3.94.1.11.1.3  
 Name: connUnitEventId  
 Value: 3

**SNMP trap type (this is an integer)**

OID: 1.3.6.1.3.94.1.11.1.7  
 Name: connUnitEventType  
 Value: 1: unknown  
 2: other  
 3: status  
 4: configuration  
 5: topology

**SNMP trap object (this is an OID)**

OID: 1.3.6.1.3.94.1.11.1.8  
 Name: connUnitEventObject  
 Value: 1.3.6.1.4.1.1139.1.3.5.4

**Trap severity (this is an integer)**

OID: 1.3.6.1.3.94.1.11.1.6  
 Name: connUnitEventSeverity  
 Value: 8

**Event Description (this is a string)**

This description is a subset of the other formats shown above. One major difference is that the Entity and Component are formatted differently - not inside an SDE '[.].')

OID: 1.3.6.1.3.94.1.11.1.9  
 Name: connUnitEventDescr

Value for Simple Event:

Symmetrix 000000006190 Device 0002 : Device state has changed to Online.

Value for an Audit Log Record Event:

Symmetrix 000000006190 : [orig=SE] [user=H:jupiter\jones]  
 [host=saturn] [actid=SEb5d5129f28] [appid=Internal\_Test]  
 [aud-cls=Security] [aud-act=Add] [aud-num=40] = The User  
 Authorization set role operation SUCCEEDED.

### Event source

OID: 1.3.6.1.4.1.1139.3.8888.1.0  
 Name: emcAsyncEventSource  
 Value: 1 = generated by the Event Daemon  
 2 = generated by the VMAX array

### Event code

OID: 1.3.6.1.4.1.1139.3.8888.2.0  
 Name: emcAsyncEventCode  
 Value: These integers represent the event itself. For details on the events, refer to [Appendix B, “Asynchronous Events.”](#) You can return a list of events and descriptions using the command `stordaeomon action storevntd -cmd list -events`.

### Array component type to which the event corresponds

OID: 1.3.6.1.4.1.1139.3.8888.3.0  
 Name: emcAsyncEventComponentType  
 Value: Numeric value defined in [Table 30](#)

### Array component name to which the event corresponds to

OID: 1.3.6.1.4.1.1139.3.8888.4.0  
 Name: emcAsyncEventComponentName  
 Value: String value such as “0070”, “SATAPool”

[Table 30](#) contains the possible values.

**Table 30** Solutions Enabler event daemon event UID values (page 1 of 2)

UID (integer value)	Component
1024	Symmetrix
1025	Service Processor
1026	Device
1027	Physical Disk
1028	Director
1029	Port
1030	SRDF sub-system
1031	SRDF group
1032	Snap Save Device Pool
1033	Cache / Memory
1034	Power or Battery subsystem
1035	Environmental (e.g.: Temperature, Smoke)
1036	Diagnostics
1037	Communications sub-system

**Table 30** Solutions Enabler event daemon event UID values (page 2 of 2)

UID (integer value)	Component
1038	External Lock
1039	Fan
1040	Link Controller Card
1041	Enclosure, Enclosure-Slot or MIBE
1042	SRDF/A DSE Device Pool
1043	Thin Device Data Pool
1044	Solutions Enabler DG group
1045	Solutions Enabler CG group
1046	Management Module
1047	IO Module Carrier
1048	Director - Environmental
1049	Storage Group
1050	Migration Session
1051	Symmetrix Disk Group

**Event host**

OID: 1.3.6.1.4.1.1139.3.8888.4.0

Value: Actually name of the component effected, such as the disk ID or device name.

## Miscellaneous options

The `daemon_options` file contains parameters (Table 31) that allow you to configure a Syslog target.

**Table 31** Event log file configuration options

Parameter	= <OptValue   defaultvalue>	Description
<code>storevntd:log_event_network_pad</code>	1 -10   0	Specifies the rate at which events are transmitted to the syslog or SNMP targets. Events are delivered to the targets using the UDP network protocol, for which certain recipient hosts (or network intermediaries) will drop messages if they arrive too quickly.  This option defines how long to wait (in milliseconds) between event transmissions. Use this option carefully, as too large a value can result in an event delivery rate that cannot keep pace with the generation rate, which can lead to queue overflows (and even loss) within the event daemon. The default value of 0 means that there is no delay between transmissions.
<code>storevntd:symm_poll_interval</code>	<i>nnn</i>   60 (seconds)	Specifies how often the event daemon checks (polls) for events to transmit. Its value indicates how often the basic event polling loop runs, in seconds.  The event daemon does not check for every type of event during every polling cycle. It checks for some events every 2 cycles, 3 cycles, 4 cycles, etc.
<code>storevntd:symm_recovery_interval</code>	<i>nn</i>   30 (minutes)	Specifies the period of time until the recovery table becomes invalid.  For events being automatically logged to syslog or SNMP by the event daemon, the event daemon loads a recovery table when it starts up in order to avoid losing track of events when it was not running. This option defines how long the recovery table is considered valid for the event daemon to load on startup.

## Test mode

Test mode is a convenient way for you to verify that the event daemon has been correctly configured. For example, if you wanted to see if you have configured the SNMP trap correctly, without the test mode, you would have to use `stordaeomon setflt` to inject various events. However, such testing can also stress the VMAX array as event daemon will try to sync up the state from the array.

To test without stressing the array, test mode is provided in the event daemon. When test mode is enabled for the event daemon, it will not sync its state with the array.

This is accomplished by specifying a parameter in the `daemon_options` file:

```
storevntd:test_mode = ENABLE|DISABLE
```

The default value for this option is `DISABLE`. The option will not take effect on `stordaeomon reload` command. The daemon needs to be restarted for any change to this option to take effect.

## VSS Provider environment variables

Update the environment variable for `path` to include the Solutions Enabler installation directory, which by default is `C:\Program Files\EMC\SYMCLI\bin`, to run the command line utilities from any directory.

## SMI-S Provider Windows authentication settings

To enable Windows authentication, you must modify default settings in the `security_settings.xml` file. On Windows platforms, this file resides in `c:\program files\emc\ecim\ecom\conf`.

To enable Windows authentication:

1. If ECOM is running, stop it, as explained in [“Starting and stopping ECOM” on page 150](#).
2. Modify the following default settings in `security_settings.xml`:

```
<ECOMSetting Name="NonCIMRequest_AuthenticationEnabled
Type="boolean" Value="false" />
```

```
<ECOMSetting Name="HTTPChallengeMechanism"
Type="string" Value="Basic" />
```

to:

```
<ECOMSetting Name="NonCIMRequest_AuthenticationEnabled
Type="boolean" Value="true" />
```

```
<ECOMSetting Name="HTTPChallengeMechanism"
Type="string" Value="Basic,WindowsAuth" />
```

3. Restart ECOM.

## VMAX arrays

When using the SMI-S Provider to manage VMAX arrays, it is recommended that you configure six gatekeepers for each array accessed by the provider. Only set up these gatekeepers for the host on which the SMI-S Provider is running. When started, the SMI-S Provider automatically discovers all arrays connected to the host on which the Array Provider is running. No other action is required, such as running the `symcfg discover` command.

When deploying the SMI-S Provider for VMAX arrays, ensure that only the arrays that will be managed by the provider are made visible to the SMI-S Provider.

As part of the Solutions Enabler discovery of VMAX arrays, those arrays that are SRDF connected to the local array being discovered will also be discovered.

If your client application only manages local arrays please symavoid these remote storage systems by creating a file called `symavoid` in `c:\program files\emc\symapi\config` on Windows or `/var/symapi/config` on Linux. In the file place the Symmetrix ID of the system to be avoided, one ID per line. The file should be named just `symavoid` - ensure it doesn't have any extension such as `symavoid.txt`. Once the file is in place shut down ECOM and remove the file `symapi_db.bin` from `c:\program files\emc\symapi\db` on Windows or `/var/symapi/db` on Linux and the startup ECOM.

Doing this reduces unnecessary syscall traffic which would otherwise be consuming SRDF link resources.

## ECC and Unisphere for VMAX 1.0 coexistence: symapi\_db.bin database sharing

When the SMI-S Provider is installed on the same host as the ECC Symmetrix agent and/or the Unisphere for VMAX 1.0, you may see the following memory allocation errors in the `syampi` log file:

```
EMC:SMBASE __iload_db_osl pdsDbRecRead() failed : OSL:CONN_INFO ([PDS/DB] (Unable to allocate memory)
```

```
EMC:SMBASE emcSymDBLoad Error encountered while reading from DB file [C:\Program Files\EMC\SYMAPI\db\symapi_db.bin] (SYMAPI_C_MEMORY_ALLOC_ERROR)
```

The factors determining these memory allocation errors are governed by the amount of physical memory on the host as well as the number and size of the array configurations. Because it is difficult to predict how much memory is required for this type of installation scenario, perform the following steps to prevent the above errors from occurring:

1. Instruct SMI-S Provider to use its own `symapi` database by editing the `c:\program files\emc\ecim\ecom\providers\oslsprovider.conf` file.
2. Change the following line in `oslsprovider.conf`:

```
#OSLSProvider/com.emc.cmp.osls.se.array.StorApi.database.filename =  
to:
```

```
OSLSProvider/com.emc.cmp.osls.se.array.StorApi.database.filename = c:/program files/emc/symapi/db/symapi_smi_db.bin
```

3. Stop ECOM, the ECC Symmetrix agents, Unisphere for VMAX 1.0, and the Solutions Enabler daemons.
4. Remove the existing `symapi_db.bin` file, and save all device group information to be later restored to the new `symapi` database.
5. Restart ECOM, the ECC Symmetrix agents, Unisphere for VMAX 1.0, and the Solutions Enabler daemons.

## ECOM

The ECOM post-installation tasks require that you set up an administrator role, supply certificates to both the ECOM server and its client, and then start ECOM.

### Setting up administrator authentication

Authentication is required to query the EMC CIM Server. An initial setup is required on the EMC CIM Server to create a CIM user. This can be done as follows:

1. Go to the URL `https://<ipaddress>:5989/ecomconfig`, and log in using the username `admin` and the password `#1Password`.
2. Click **Add User** and create a user with the role of **Administrator**. This newly created username can now be used to obtain access to the SMI-S Provider.

---

**Note:** For security reasons, change the default password of the user `admin`.

---

## ECOM certificate management

In order for SSL communications between two peers to be authenticated, one of the following conditions must exist:

- ◆ If a peer presents a self-signed certificate, the host receiving the self-signed certificate must have its trust store seeded with that certificate.
- ◆ If a peer presents a CA-signed certificate, the host receiving the CA-signed certificate must have its trust store seeded with a chain of certificates starting from the issuer of the peer's certificate and ending with the root certificate.

Installing certificates in trust stores is performed at configuration time, not at runtime. The following sections describe how to supply certificates to both the ECOM server and its client.

### Supplying a client with the ECOM server certificate

1. Obtain the ECOM certificate (`ecomtls.crt`) from the directory `<ECOM_Home>\conf\ssl`.
2. If `ecomtls.crt` does not exist, point your browser to the ECOM Admin page `https://<server>:<port>/ECOMConfig`. The connection fails as the trust store is not yet set up but the certificate is generated.
3. Add the ECOM certificate (`ecomtls.crt`) to the client's trust store. The certificate is in PEM format.

### Supplying ECOM with the client certificate

To authenticate the client certificate, you must import the client certificate into the ECOM trust store. To do this, you must append the certificate to the file `ecomtls.ca` found in the directory `<ECOM_HOME>\conf\ssl`.

Follow these steps:

1. Obtain the client certificate from an SSL certificate provider.

---

**Note:** ECOM accepts certificates in PEM format only at this time.

---

2. Point your browser to the ECOM Administration Login page:  
`https://<ServerName>:5989/ECOMConfig`
3. Select the **SSL Certificate Management** submenu.
4. Select **Import CA certificate file** to import the certificate. You do this by cut/pasting the certificate to the end of the list of already existing certificates if any exist.
5. Re-start ECOM.

## Starting and stopping ECOM

ECOM runs on both Windows and UNIX environments. After installation completion, ECOM automatically starts. You can use the following commands to manually stop and restart the service should the need arise.

### ECOM failure to start

If ECOM does not start, review the problem resolutions in the following sections.

#### Security initialization failure

Red Hat and SuSE Linux platforms may generate the following set of errors when ECOM does not start:

```
02-Nov-2010 15:09:52.091 -3086366416-W- ECOM: CST Lockbox Initialization
Error:ERR_LIB_NOT_INIT
```

```
02-Nov-2010 15:09:52.091 -3086366416-C- ECOM: -E- Security manager initialization
failed. Check whether the security plugin exists and is set up properly.
```

If you receive the above errors, complete the following steps:

1. Change directory to `/opt/emc/ECIM/ECOM/thirdparty` and issue the following command:

```
[root@losaz134 thirdparty]# ./cstadmin initialize
/opt/emc/ECIM/ECOM/conf/cst
```

2. A request for a lockbox passphrase displays. Enter a text string for the passphrase:

```
Enter lockbox passphrase:
Confirm passphrase:
```

#### Unsupported SELinux setting is enabled

The following error indicates an unsupported SELinux setting is enabled, which is the default for Red Hat, and must be disabled:

```
cstadmin: Failure initializing lockbox
/opt/emc/ECIM/ECOM/conf/cst. [The cryptography library was not initialized.] [-48]
Failed to retrieve Log Service: The cryptography library was not initialized.
[/opt/emc/ECIM/ECOM/conf/cst/csp.clb]
```

To temporarily disable this SELinux setting, complete the following steps:

```
[root@losaz134 ~]# cat /selinux/enforce
1
[root@losaz134 ~]# echo 0 >/selinux/enforce
[root@losaz134 ~]# cat /selinux/enforce
0
[root@losaz134 ~]# cd /etc
[root@losaz134 etc]# cd selinux
```

To permanently disable this SELinux setting, follow the instructions at:

[http://www.crypt.gen.nz/selinux/disable\\_selinux.html](http://www.crypt.gen.nz/selinux/disable_selinux.html)

## Windows

On Windows, ECOM runs as a service and can be controlled through the Windows **Services** control panel. The service name is `ECOM.exe` and it displays as `ECOM` in the **Services** control panel.

As an alternative method for stopping and starting ECOM, the `ECOM.exe` file is located in the Solutions Enabler `C:/Program Files/EMC/ECIM/ECOM/bin` directory. Use the following command to start the EMC CIM Server:

```
sm_service start ecom.exe
```

Use the following command to stop ECOM:

```
sm_service stop ecom.exe
```

## UNIX

On UNIX, ECOM runs as a daemon in the background. To stop ECOM, obtain the PID of the ECOM process and issue the `kill -SIGTERM` command for that PID. For example:

```
kill -SIGTERM [PID]
```

The ECOM executable file is located in the Solutions Enabler `/opt/emc/ECIM/ECOM/bin` directory. Use the following command from this directory to restart ECOM:

```
./ECOM -d
```

## Disabling ports

After installation, ports 5985, 5988 and 5993 are not encrypted using SSL. These ports can be disabled by modifying the file `port_settings.xml` which is located in `C:\Program Files\emc\ecim\ecom\conf` on Windows, and in `/opt/emc/ECIM/ECOM/conf` on Linux.

By default, the following entry is shown in the file:

```
<ECOMSettings>
<ECOMSetting Name="Port0">
<!--
  <portRange>5988</portRange>
-->
  <port>5988</port>
  <secure>>false</secure>
  <slp>>true</slp>
</ECOMSetting>

<ECOMSetting Name="Port2">
<!--
  <portRange>5985</portRange>
-->
  <port>5985</port>
  <secure>>false</secure>
  <slp>>true</slp>
</ECOMSetting>

<ECOMSetting Name="Port4">
<!--
  <portRange>5993</portRange>
-->
  <port>5993</port>
```

```

    <secure>>false</secure>
    <slp>>true</slp>
  </ECOMSetting>

```

To block these ports from being setup by ECOM, make the changes as shown below: (please note the characters highlighted in red that were moved down completely blocking the associated ports from being setup by ECOM).

```

<ECOMSettings>
<ECOMSetting Name="Port0">
<!--
  <portRange>5988</portRange>
  <port>5988</port>
  <secure>>false</secure>
  <slp>>true</slp>
</ECOMSetting>
-->

<ECOMSetting Name="Port2">
<!--
  <portRange>5985</portRange>

  <port>5985</port>
  <secure>>false</secure>
  <slp>>true</slp>
</ECOMSetting>
-->

<ECOMSetting Name="Port4">
<!--
  <portRange>5993</portRange>

  <port>5993</port>
  <secure>>false</secure>
  <slp>>true</slp>
</ECOMSetting>
-->

```

Once these changes are made save the file and restart ECOM. As a result, ports 5985, 5988 and 5993 are no longer started.

## SMI-S Provider runtime settings

The `OSLSProvider.conf` file allows you to control the runtime behavior of the SMI-S Provider. You can find this file in the following directories of the Solutions Enabler:

- ◆ Windows platforms:  
C:/Program Files/EMC/ECIM/ECOM/Providers
- ◆ UNIX platforms:  
/opt/emc/ECIM/ECOM/providers

Table 32 describes the SMI-S Provider runtime settings. In order for these runtime settings to take effect, you must stop and then restart ECOM.

**Table 32** SMI-S Provider runtime settings

SMI-S Provider properties <sup>1</sup>	= <OptVal  DefaultVal>	Description
OSLSProvider /com.emc.cmp.osls.se.symm.SymApiService.database.discover	true   false	Specifies whether to perform a one-time discover upon starting a CIM Server. This is done before processing the first request received by the CIM Server.
*/com.emc.cmp.ofl.log.Control.severity.id	FATAL, ERROR, WARNING, NOTICE, INFO	Specifies the severity levels for the event logs: FATAL — Events leading to shutdown of the system ERROR — Internal or client error conditions WARNING — Potential errors NOTICE — Very important information (default if not present) INFO — Informational, non-error messages  Each setting causes messages of the set severity and more severe to be appended to the log.
#OSLSProvider/com.emc.cmp.osls.se.symm.Session.All.controls.enable	false   true	If false, disables all controls. A false setting takes precedence over all control settings previously explained in this table.

1. The path shown is a UNIX-specific default installation path. Your actual install path may differ.

## RedHat Enterprise Linux 6.0/6.2 [GA] - x86\_64 installation

Solutions Enabler V8.0 installation requires i686 version of `glibc` (GNU C Library) and `libgcc` (Library of GCC support routines) packages pre-installed.

**RHEL 6.0** If your RHEL 6.0 (x86\_64) host does not have `glibc` and `libgcc`, use the following commands to install `glibc` and `libgcc`:

```
# cd media/<RHEL_6.0 x86_64 Disc mount point>/Packages
# rpm -ivh glibc-2.12-1.7.el6.i686.rpm glibc-devel-2.12-1.7.el6.i686.rpm
nss-softokn-freebl-3.12.7-1.1.el6.i686.rpm libgcc-4.4.4-13.el6.i686.rpm
Preparing... ##### [100%]
1:libgcc ##### [ 25%]
2:nss-softokn-freebl ##### [ 50%]
3:glibc ##### [ 75%]
4:glibc-devel ##### [100%]
```

After the installation, query the rpm as shown below:

```
# rpm -qa | grep i686 | grep lib
glibc-devel-2.12-1.7.el6.i686
libgcc-4.4.4-13.el6.i686
glibc-2.12-1.7.el6.i686
# rpm -qa | grep i686 | grep nss
nss-softokn-freebl-3.12.7-1.1.el6.i686
```

**RHEL 6.2** If your RHEL 6.2 (x86\_64) host does not have `glibc` and `libgcc`, use the following commands to install `glibc` and `libgcc`:

```
# cd media/<RHEL_6.2 x86_64 Disc mount point>/Packages
# rpm -ivh glibc-2.12-1.47.el6.i686.rpm nss-softokn-freebl-3.12.9-11.el6.i686.rpm
Preparing... ##### [100%]
1:nss-softokn-freebl ##### [ 50%]
2:glibc ##### [100%]
# rpm -ivh libgcc-4.4.6-3.el6.i686.rpm
Preparing... ##### [100%]
1:libgcc ##### [100%]
```

After the installation, query the rpm as shown below:

```
# rpm -qa | grep i686 | grep lib
libgcc-4.4.6-3.el6.i686
glibc-2.12-1.47.el6.i686
# rpm -qa | grep i686 | grep nss
nss-softokn-freebl-3.12.9-11.el6.i686
```

## Adding the SSL certificate

If the "cert" component is not initially installed, and then added (by running the installer again) or by performing an incremental install, on AIX and Linux platforms, the SSL certificate is not created.

You can create the SSL certificate by entering the following:

```
# cd /var/symapi/config/cert
# /usr/symcli/bin/manage_server_cert create -pass <lockbox_pwd>
```

where

<lockbox\_pwd> is the lockbox password that was used during the installation.

## Vendor SNIA libraries needed for HBA information

There are certain SNIA libraries (Emulex or Qlogic) which need to be installed so that Solutions Enabler CLI can obtain host HBA information. By default, SNIA libraries are not pre-installed on the host. Follow these steps to install the SNIA libraries:

1. Find the vendor information and model.

```
ESI144:~ # cat /sys/class/fc_host/host1/symbolic_name
Emulex LPe12002-M8 FV2.00A4 DV8.3.5.8.1p
ESI144:~ #
```

2. Open the Emulex download page (<http://www.emulex.com/downloads.html>) and select **EMC**.
3. Select the specific version identified in step 1 (**LPe12002**) from **Fibre Channel Host Bus Adapters...** section. This opens the **EMC Qualified Downloads and Documentation** page.
4. Select the **Drivers** tab and select the **Operating System** and **version**. This selection opens the **Downloads** page.
5. Select the **Management and Utilities** tab and download the Application Kit **6.0.9.1-1 (CLI)** from the **UCNA and HBA Application Kit** section.
6. Install the application kit.

Upon successful installation, `/etc/hba.conf` will be created (if the file doesn't exist) and will have the following entry:

```
ESI144:~ # cat /etc/hba.conf
com.emulex.emulexapilibrary /usr/lib64/libemulexhbaapi.so
com.emulex.emulexapilibrary /usr/lib/libemulexhbaapi.so
ESI144:~ #
```

---

**Note:** Repeat the same steps for each operating system type.

If the host has Qlogic, follow similar steps from the [https://support.qlogic.com/ Downloads](https://support.qlogic.com/Downloads) page.

---

# CHAPTER 4

## Remote Operations

This chapter provides information on configuring and operating Solutions Enabler in a client/server environment:

- ◆ [SYMCLI through a remote server.....](#) 156
- ◆ [Client configuration.....](#) 156
- ◆ [Client/server IP interoperability.....](#) 161
- ◆ [Client/server security.....](#) 163
- ◆ [Specifying server behavior.....](#) 163
- ◆ [Controlling the server.....](#) 165
- ◆ [Controlling and using the storsrvd log files.....](#) 168

## SYMCLI through a remote server

In the UNIX, Linux, and Windows environments, the SYMAPI server runs in a background process started by the `stord daemon start storsrvd` command. In the z/OS environment, it runs as a job step task specified on the EXEC PGM= statement in a job stream. The server reads its configuration from the `daemon_options` file, and records log information in its own log file set, which resides in the SYMAPI logging directory.

The server is a multi-threaded program that listens for SYMAPI sessions and management requests initiated by the `stord daemon` command. The server also listens for management requests from the system operator console.

While session threads come and go, the server continues to accept connection requests until an operator enters a command to initiate the server shutdown process. The operator has the choice to end the server safely, where the server will wait for all current sessions to terminate on their own, or to end the server immediately, in which case the server will simply terminate all current session threads without giving them a chance to end on their own. The former method is preferred, when there is time to let sessions continue until they are done. The latter method can be used in an emergency, especially when a catastrophic condition occurs that requires a restart of the entire system.

Each session has a sequentially assigned session number, and an associated thread number. The operator can use the session number when referring to a session in a command. For example:

```
stord daemon action storsrvd -cmd show -sessions -num session_number
```

You can use the thread name (`SESS nnnn`, where *nnnn* is the session number) to identify log message issued by session threads.

## Client configuration

This section explains how to configure a Solutions Enabler client.

### Editing the netcnfg file

The `netcnfg` file is a template and an editable file located in the SYMAPI configuration directory.<sup>1</sup>

There are two ways to configure services in the `netcnfg` file:

- ◆ **Single entry Service Name (legacy method):** individual service name entries are specified, one for each server. Specify a hyphen (-) or the reserved word `Single` to indicate a single entry service name.
- ◆ **Paired entry Service Name:** two entries use the same service name, with a special indicator that controls how the SYMAPI library will choose an entry to initiate a remote session. Specify the word `Ordered` or `Balanced` to indicate a paired entry service name.

---

1. The location of this directory varies according to the operating system. For more information, refer to [Appendix E](#).

Using a text editor, a System Administrator must add the network services to the file in the format of the relevant entry configuration.

## Single entry Service Name

In the case of Single entry Service Names, use the following syntax:

```
service_name pairing_method network_protocol server_node_name server_network_address
port_number security_level
```

where:

*service\_name* is the name of the service.

*pairing\_method* the hyphen (-) or the *Single* entry specifies this as a Single entry (legacy method).

*network\_protocol* must be TCPIP.

*server\_node\_name* is the name of the server host.

*server\_network\_address* is the network address of the server. If this is specified, this value overrides the entry specified in the *server\_node\_name*.

---

**Note:** You can substitute a hyphen (-) for an unspecified *server\_node\_name* or *server\_network\_address*, but at least one must be specified. For more information, refer to [“Considerations for specifying server\\_node\\_name and server\\_network\\_address” on page 159.](#)

---

*port\_number* is the server port number.

*security\_level* is the type of connection the client is expecting to negotiate. Possible values are SECURE, ANY, and NONSECURE. In addition, you can specify a hyphen (-) to use the platform’s default setting. For more information, refer to the *EMC VMAX Family Security Configuration Guide*.

*Example* In the following example, three site-specific service names (SYMAPI\_SERVER, BACKUP\_SERVER and SERVER\_IP6) are specified as available by the administrator:

```
SYMAPI_SERVER - TCPIP node001 12.345.67.89 7777 ANY
BACKUP_SERVER - TCPIP node002 - 6666 SECURE
SERVER_IP6 - TCPIP node003 3FFE:80C0:22C:18:250:88FF:FEAD:F92F 6666 SECURE
```

Comment text can be entered by placing a pound sign (#) in the first character space of the comment line.

## Paired entry Service Name

There are two options of Paired entries:

- ◆ Ordered pairing means that the SYMAPI client library will first attempt a client/server session with the server named as the first of the two entries. If that attempt fails, the library will try the second one.
- ◆ Balanced pairing means that the SYMAPI client library randomly chooses the first server which will be used for a client/server session. If that attempt fails, the library will try the other entry.

In the case of Paired entries, use the following syntax:

```
service_name pairing_method network_protocol server_node_name server_network_address
port_number security_level
```

where:

*service\_name* the same service name is specified in both entries.

*pairing\_method* the *Ordered* entry specifies an ordered pairing of two entries, while the *Balanced* entry specifies a random selection method.

*network\_protocol* must be TCPIP.

*server\_node\_name* is the name of the server host.

*server\_network\_address* is the IP address of the server host. If this is specified, this value overrides the entry specified in the *server\_node\_name*.

*port\_number* is the server port number.

*security\_level* is the type of connection the client is expecting to negotiate. Possible values are SECURE, ANY, and NONSECURE. In addition, you can specify a hyphen (-) to use the platform's default setting. For more information, refer to the *EMC VMAX Family Security Configuration Guide*.

**Example** In the following example, two site-specific service names (SYMAPI\_SERVER, BACKUP\_SERVER) are specified, as ordered and balanced respectively, as available by the administrator:

```
SYMAPI_SERVER Ordered TCPIP node001 - 7777 ANY
SYMAPI_SERVER Ordered TCPIP node002 - 7777 ANY
BACKUP_SERVER Balanced TCPIP node003 - 6666 SECURE
BACKUP_SERVER Balanced TCPIP node004 - 6666 SECURE
```

Comment text can be entered by placing a pound sign (#) in the first character space of the comment line.

## NOTES

- ◆ Both balanced and ordered pairing methods require two entries with the same name and pairing method specified in the file. It is invalid to specify one entry without a second.
- ◆ The number of balanced and ordered entries for a given service name may exceed two, but only the first two will be used. If validation of the first two succeeds, the service name will be considered valid and the first two entries will be candidates for connection attempts.
- ◆ The *server\_node\_name* fields in both paired entries may be different, or one or both may be a hyphen indicating that the value is omitted.
- ◆ The *IP\_address* fields in both paired entries may be different or may both be a hyphen indicating that the host name must be used. Whenever there is no IP address specified, the *server\_node\_name* must be specified.
- ◆ DNS queries may return more than one IP address for a given host name. If a host name is mapped to two different IP addresses, the SYMAPI client library will attempt to connect to the first one. If the connection fails, the client library will try the second one. If both addresses in the first entry fail, the client library will repeat the process with all IP addresses associated with the second host.
- ◆ The *port\_number* fields in both paired entries may be different.

- ◆ The `security_level` must be the same for both paired entries.

## Considerations for specifying `server_node_name` and `server_network_address`

Although the syntax of each service definition allows you to specify both the node name and the network address, only one is in fact required. Specifying both can serve as documentation for your expectation of the mapping between node and address, but it has no real effect on connections established between the client and the server.

Any unspecified tokens in the service definition must be replaced with a hyphen, so if either the `server_node_name` or `server_network_address` are to be omitted, be sure to place a hyphen character in its position.

Use the following general rules to decide whether to specify a real value for `server_node_name` or `server_network_address`:

- ◆ If you do not want to have to remember or look up IP addresses, or if your network administrator discourages routing by address, then specify a real value for `server_node_name` and place a hyphen in the `server_network_address` field. The SYMAPI client library will look up the node name in DNS, and will attempt to connect to the server using the list of known addresses for the node. If you specify `server_node_name`, however, you cannot predict the address that will be used to successfully connect.

Note that the value specified in the `server_node_name` can generally be a local node without qualifying domain, or it can be a fully-qualified domain name (FQDN). Your results depend on the configuration of name resolution in your network.

Another key reason for using node name is that the client will try all eligible network addresses for a given node to complete the connection. Even though you have no specific control over the protocol or address used, the server availability may be improved using node name.

- ◆ If you want more control over the network address chosen (including the protocol) for the connection, specify a real value for `server_network_address` and place a hyphen in the `server_node_name` field. In fact, if any value is specified in the address field, it will be used, regardless of the value specified in the `server_node_name` field.

Note that specifying the address implies that you know the protocols that will be in use on the server host. For example, if you specify an IPv4 address for a server which is no longer using IPv4 (not likely for years to come), the connection will fail. If you specify an IPv6 address for a server host whose IPv6 link is inoperative, the connection will fail. A host in this state might still be reachable over IPv4; by using the node name instead, the connection might succeed.

You can specify an IPv4 address or an IPv6 address. You may be able to use an IPv4-mapped address, but a successful connection using the mapped address will depend on whether the operating system of the server host is one that uses V4-mapping. In general, using IPv4-mapped addresses is discouraged.

## Setting environment variables for remote access

To use SYMCLI through a remote SYMAPI service, you should set environment variable `SYMCLI_CONNECT` to an available service name of the server connection (defined in `netcnfg`). For example, for service name `SYMAPI_SERVER`, set the environment variable as follows:

<code>setenv SYMCLI_CONNECT SYMAPI_SERVER</code>	for UNIX C shell
<code>define SYMCLI_CONNECT SYMAPI_SERVER</code>	for OpenVMS
<code>set SYMCLI_CONNECT=SYMAPI_SERVER</code>	for Windows

To determine what network services are configured, enter:

```
symcfg list -service
```

Connection variable `SYMCLI_CONNECT_TYPE` should define the local/remote mode of the local host (client). Possible values for the client are:

REMOTE

Defines a client operation in which all the remote SYMCLI commands are strictly executed on the server, and the VMAX array database is strictly read and updated remotely.

LOCAL

Defines a local connection to the VMAX array. (Not used for a client-server connection.)

*Example* To set the connection environment variables for a locally-cached remote operation, enter:

```
setenv SYMCLI_CONNECT_TYPE  REMOTE
```

## Client/server IP interoperability

In a UNIX, Linux, or Windows environment, the SYMAPI client and server are both capable of negotiating sessions over the traditional Internet Protocol Version 4 (IPv4) and the newer Internet Protocol Version 6 (IPv6).

The IPv6 designers expected migration from the old protocol to the new protocol to take years. They designed the new protocol for interoperation in networks where both are present. A network administrator can introduce the IPv6 protocol as a supplement to IPv4, where IPv4 hosts and IPv6-capable hosts can interoperate with minimal disruption. Over time, as network configuration is improved and problems are reduced and eliminated, IPv4 protocols can be dropped in favor of IPv6. Such a transition scheme is essential in environments where continual operation is a key business success factor.

In the UNIX, Linux, and Microsoft Windows Server environments, Solutions Enabler also supports the transition from IPv4 to IPv6 in a seamless fashion. With proper configuration of host operating systems, routers, and DNS servers, Solutions Enabler supports concurrent connections from clients using both IPv4 and IPv6. The client and server software will choose either IPv4 or IPv6 to communicate, depending on specification in configuration files of the host operating system and Solutions Enabler.

## IPv6 addresses

The IPv4 address is familiar to most computer users: a 32-bit unsigned integer is displayed in a dotted-decimal string. For example, 172.23.191.20 (0xAC17BF14).

The IPv6 address supports many addressing features, but the most obvious attribute is its much wider addressing space: a 128-bit code is displayed as a series 16-bit groupings (represented in hexadecimal) separated by colons. Shorthand notation rules improve the usability of the IPv6 display address; nonetheless, an IPv6 address is not a human-friendly object. For example, one machine might be represented with this address:

```
3ffe:80c0:22c:18:250:8bff:fead:f92f
(0x3FFE80C0022C001802508BFFFEADF92F)
```

## IPv4 address mapping

The interoperation of IPv4 and IPv6 varies from one operating system to another, according to the specification of IPv6. On some host operating systems, IPv4 connections are made through the native IPv4 protocol, and IPv4 addresses are represented as the dotted-decimal addresses which are familiar.

Other OS vendors have chosen to complete client connections from an IPv4 machine over IPv6, where the IPv4 address is represented as an IPv4-mapped address. An IPv4-mapped address appears in colonated-hexadecimal form, where the last 32-bits of the address are shown as the dotted-decimal IPv4 address (they may also be shown as two pairs of hexadecimal bytes). Immediately preceding the IPv4 address is the string `::FFFF::`. For example, a host whose IPv4 address is 172.23.191.20 can be represented as a IPv4-mapped address as follows:

```
::FFFF:AC17:BF14      or
::FFFF:172.23.191.20
(0x000000000000000000000000FFFFAC17BF14)
```

IPv4-mapped addresses are used by operating systems that do not support concurrent binding to the same port over both IPv6 and IPv4. AIX, and Linux generally use IPv4-mapped addresses.

SunOS, HP-UX, and Microsoft Windows 2003 allow concurrent binding on both IPv6 and IPv4 protocols.

## Server operation

The SYMAPI server listens for arrival of client connections on either IPv6 or IPv4 protocols, or on both where possible. The server begins by attempting to bind to the *unspecified address* using the IPv6 protocol. It then attempts to bind the unspecified address using the IPv4 protocol.

The *unspecified address* is a special-purpose Internet address used primarily by server applications. It indicates that an application is ready to receive a connection on any internet address configured on the host with a matching protocol. For hosts that have multiple network interfaces, it increases the availability of the server application by not limiting connections to arrive by way of a specific address.

The server insists on at least one successful bind on either IPv6 or IPv4 protocols, and will use both if available to continue initializing. If both bind attempts fail, the server will terminate immediately, since no network is accessible or the port is in use.

When the server has finished initializing for network communication, it will write the following message to its SYMAPI log file and to the terminal device, if one is available:

```
ANR0020I SYMAPI server listening on port port over protocols
```

Where *port* is the decimal port number to which client connections should be directed, and *protocols* are the protocols the server is using to listen for client connections. Possible values are:

- ◆ **IPv6 and IPv4** — Indicates that the server will accept connections from clients running either IPv6 or IPv4.
- ◆ **IPv6 with IPv4 mapping** — Also indicates that the server will accept connections from clients running either IPv6 or IPv4. Connections from IPv4 clients will be represented on the server side as an IPv4-mapped address (refer to [“IPv4 address mapping” on page 161](#)).
- ◆ **IPv4 only** — Indicates that IPv6 bind failed. Connections can only be accepted from IPv4 clients.

## Client operation

The SYMAPI client library will attempt to connect to the server either by node name or by internet address, depending on how the service name is specified in the `netcnfg` file.

If the internet address of the server is specified, the client makes a single attempt to connect to the server. The client chooses the protocol based on the nature of the address: if it is an IPv4 address, it will specify IPv4 as the protocol. Similarly, specifying an IPv6 address (including an IPv4-mapped address) will result in the client using the IPv6 protocol to connect to the server.

If the node name of the server is specified, the client will lookup the server host by name. Such a lookup operation can return a list of candidate addresses, potentially including both IPv4 and IPv6 addresses. The client library will try to connect to all eligible addresses until either a connection attempt succeeds, or the list is exhausted with no successes. The list of eligible server addresses depends on the static and dynamic name resolution configuration of the host on which the client is running.

## Client/server security

By default, the SYMAPI client and server, on platforms that will support it, are initially configured to negotiate only secure sessions. To modify this default behavior, you can configure the security level at which the client and server are operating. You can also change many other aspects of secure client/server operation. Refer to the *EMC VMAX Family Security Configuration Guide* for more information on client/server security and how to configure related settings.

## Specifying server behavior

[Table 33](#) describes the `daemon_options` file parameters that you can use to control the behavior of the SYMAPI server daemon `storsrvd`.

For information on editing these parameters, refer to [“Controlling daemon behavior” on page 120](#).

**Table 33** `storsrvd` options for the `daemon_options` file (page 1 of 2)

Parameter	Possible values <sup>a</sup>	Reloadable
<code>port</code> Specifies the decimal port number.	= <i>nnnn</i>   <b>2707</b>	No
<code>log_show_category</code> Specifies whether the specific <code>storsrvd</code> log category value should be displayed when a log message is written.	= <b>ENABLE</b>   <b>DISABLE</b> ENABLE: The category associated with the log event is shown as part of the text message. DISABLE: The category is not shown as part of the message.	Yes
<code>log_show_msgid</code> Specifies whether the specific <code>storsrvd</code> message identifier should be displayed when a log message is written.	= <b>ENABLE</b>   <b>DISABLE</b> ENABLE: The message ID of a <code>storsrvd</code> application log message is shown as part of the text message. DISABLE: The message ID is not shown as part of the message.	Yes
<code>log_level</code> Specifies a severity-based control over logging volume. Messages that are issued with a severity equal to or exceeding the level specified will be recorded in the log file. Do not use <code>debug</code> or <code>verbose</code> without direction from EMC Customer Support.	= <b>ERROR</b>   <b>INFO</b>   <b>DEBUG</b>   <b>VERBOSE</b>   <b>WARNING</b>	Yes

**Table 33** storsrvd options for the daemon\_options file (page 2 of 2)

Parameter	Possible values <sup>a</sup>	Reloadable
<p>log_filter</p> <p>Specifies the types of events to log.</p>	<p>= SERVER   SESSION   APIREQ   <b>CONTROLS</b></p> <p>SERVER: Log high level events related to initialization, termination, and main thread.</p> <p>SESSION: Log logical session events (arrival, termination, security level, authorization rejections).</p> <p>APIREQ: Log SYMAPI activity (request start and stop (with completion status)).</p> <p>CONTROLS: Log control session handling information (command parsing, execution).</p> <hr/> <p><b>Note:</b> Leaving this parameter commented out will result in the SYMAPI server application-level messages not being logged.</p>	Yes
<p>security_alt_cert_file</p> <p>Specifies an alternate certificate file to the certificate file provided at installation. The specified file should have a matching security_alt_key_file option set for the matching key file. A full path name must not be specified. Specify the name of a file that resides in the &lt;SYMAPI_HOME&gt;/config/cert directory.</p>	<p>= Any valid simple file name   <b>symapisrv_cert.pem</b></p>	No
<p>security_alt_key_file</p> <p>Specifies an alternate key file to the key file provided at installation. The file specified should have a matching security_alt_cert_file option set for the matching certificate file. A full path name must not be specified. Specify the name of a file that resides in the &lt;SYMAPI_HOME&gt;/config/cert directory.</p>	<p>= Any valid simple file name   <b>symapisrv_key.pem</b></p>	No
<p>security_clt_secure_lvl</p> <p>Controls the verification of the client certificate by the server. This parameter is not supported in z/OS. This value is ignored if secure communications are not established.</p>	<p>= NOVERIFY MUSTVERIFY   <b>VERIFY</b></p> <p>NOVERIFY: Indicates that the server will not verify the client certificate.</p> <p>MUSTVERIFY: Indicates that the server will only accept communications from a version of the client that can send a certificate to be verified.</p> <p>VERIFY: Indicates that the server will verify a client certificate if the version of the client can send a certificate.</p>	Yes

a. Default values are **bold**.

## Controlling the server

This section explains the commands used to control the SYMAPI server.

### Starting the server

If you have not already configured your host to start the server automatically, then you must start the SYMAPI service using the following command executed from the server side:

```
stordaeomon start storsrvd
```

### Stopping the server

To stop the SYMAPI service from the server side, use the following command:

```
stordaeomon shutdown storsrvd
```

### Showing server details

The `stordaeomon show storsrvd` command displays the following information regarding the SYMAPI server:

- ◆ SYMAPI version
- ◆ Total number of sessions since startup
- ◆ Current active sessions
- ◆ `log_show_msgid` setting
- ◆ `log_show_category` setting
- ◆ Enhanced authentication setting

In the z/OS environment:

- ◆ `cond_hdlr` (condition handler)
- ◆ Version of the language environment library

The `stordaeomon action storsrvd -cmd show server` command displays the same information as the `stordaeomon show storsrvd` command with the addition of operating system information.

The following example shows the output of a `stordaeomon show storsrvd` command:

```
stordaeomon show storsrvd
```

```

Daemon State                : Running
Daemon Start Time           : Wed Apr 10 08:18:35 2014
Version                      : V8.0.3-1900 (0.0)
Auto-Restart by Watchdog    : Disabled

Total Number of Connections  : 2
Number of Active Connections : 0
Total Number of Requests    : 0

ANR0123I Show Server Details :

SYMAPI Version              : V8.0.3.0   (Edit Level: 1900)
SYMAPI Session Total/Active : 0/0
SYMAPI Session Port         : 2707
Security Level               : ANY
Show ANR Category           : Disabled
```

```

Show ANR Message Id           : Enabled
Enhanced Authentication       : Disabled
Client Verification Level     : VERIFY
Transfer Protocol Version     : 2
Maximum Sessions              : 100
Maximum Sessions per Host     : NOLIMIT
Maximum Sessions per User     : NOLIMIT
Symapi Debug Permitted       : SERVER
Allow Wildcarded Certificates : Enabled

```

In the above example:

- ◆ The first seven lines of the display are generated by common logic. All daemons display lines similar to these, with information that reflects the state of the daemon.
- ◆ The lines following the message ANR0123I are generated by storsrvd, and will not display for any other daemon.
- ◆ `Total Number of Connections` is the total connections handled during the life of the daemon process. For most daemons, this includes control sessions (those that execute commands to control the daemon) and application sessions (those that need application services provided by the daemon). This number does not include the dedicated session managed by the z/OS Console thread.
- ◆ `Number of Active Connections` is the number of currently executing control sessions and application sessions.
- ◆ `Total number of Requests` is the number of control commands and application requests (SYMAPI function calls received at the server).
- ◆ `SYMAPI Session Total/Active` is the number of SYMAPI sessions only; it does not include the number of control sessions.

The following example shows the output of a `stordaeomon action storsrvd -cmd show server` command:

**stordaeomon action storsrvd -cmd show server**

ANR0123I Show Server Details:

```

SYMAPI Version                : V8.0.3.0   (Edit Level: 1900)
SYMAPI Session Total/Active   : 0/0
SYMAPI Session Port          : 2707
Security Level                : ANY
Show ANR Category            : Disabled
Show ANR Message Id          : Enabled
Enhanced Authentication       : Disabled
Client Verification Level     : VERIFY
Transfer Protocol Version     : 2
Maximum Sessions              : 100
Maximum Sessions per Host     : NOLIMIT
Maximum Sessions per User     : NOLIMIT
Symapi Debug Permitted       : SERVER
Allow Wildcarded Certificates : Enabled

```

ANR0123I Show OS Information Details:

```

Process ID                    : 20576
Host OS Name/Version          : Linux/2.6.18-194.el5
Processor Model/CPUs          : x86_64/2

```

ANR0123I Show Symapi Debugging Details:

```

SYMAPI_DEBUG                  : 0x00000000

```

```

SYMAPI_DEBUG2                : 0x00000000
SYMAPI_DEBUG_CONTROLS        : 0x00040100
SYMAPI_DEBUG_FILENAME        : /var/symapi/log/debug/storsrvd_debug.log

```

## Displaying networking information

The `show -netinfo` command displays information about the `storsrvd` networking interfaces. For example:

```

stordaeomon action storsrvd -cmd show -netinfo

ANR0123I Show Network Details:

SYMAPI Session Port          : 2707
IP Protocols                  : IPv6 with IPv4 mapping
Host Name                     : Host1051
IP address                    : 172.23.193.51

```

The above example includes information on the following:

- ◆ The port on which the server is listening.
- ◆ The IP protocols accepted by the server.
- ◆ The node name without the domain.
- ◆ The IP address line will be repeated for as many IP addresses as are known by the resolver configuration (local host files or DNS) on the host. Multi-homed hosts may show multiple lines, and hosts known by both IPv4 and IPv6 addresses may show multiple lines.

## Reloading the `daemon_options` file

The `reload` command re-reads the `daemon_options` file, and adjusts its behavior according to the specified options. For example:

```

stordaeomon action storsrvd -cmd reload

```

## Summarize active SYMAPI sessions

The `list -sessions` command shows a one line summary of each currently active SYMAPI session thread. The list includes the session number (ordered by connection arrival), the thread number processing the session, the client host userid, and the host name or IP address where the session originated. For example:

```

stordaeomon action storsrvd -cmd list -sessions

```

## Show session details

The `show -session` command displays details about active sessions. This command uses the following form:

```

stordaeomon action storsrvd -cmd show -session
[-num session_num] [-hostinfo]

```

Where:

`-num session_number` shows details on a particular session. If this option is not specified, the command will show details for all active sessions. If this option is used and the session number does not exist, an error message will display. You can view a list of session numbers using the `list -sessions` command.

`-hostinfo` shows details about the client host.

The following example shows the output of a `show -session` command:

```
stordaemon action storsrvd -cmd show -session -hostinfo
```

```
storsrvd
ANR0124I ==== Show Session Details for Session 1 on Thread 2:
User/Host:      Joe/Host127.aaa.bbb.com
Authentication
SYMAPI Version: 8.0.3
Session Started: 2015/04/22 17:25:53   Seclevel: NONSECURE
Total Requests: 2
Last Request:   SymUserContextSet  (4190)
                Started:           2015/03/20 13:07:32
                Ended:             2015/03/20 13:07:32   Result:      0 (SYMAPI_C_SUCCESS)
Client host information:
PID:            11992
OS:             SunOS
Addressing:     64-bit
Charset:        ASCII
Byte Order:     Big Endian
```

The previous example includes information on the following:

- ◆ Remote client user name and host name (if it can be resolved, IP address if it cannot be resolved)
- ◆ API library version in use by the client, and architecture (64-bit)
- ◆ Session start time and security level
- ◆ Start time of the last API request, and the numeric code of the API
- ◆ End time of the last API request and the completion code, as well as the SYMAPI return code name (as defined in `efbcore.h`)
- ◆ Process ID of the client

## Controlling and using the storsrvd log files

The server writes data to its log files provided by the common daemon infrastructure. These log files are named and handled in a manner consistent with other daemon log files. For example, under the default log management behavior, the files `storsrvd.log0` and `storsrvd.log1` are created in `/var/symapi/log`.

The behavior of the log files is subject to the standard daemon options: `logfile_type`, `logfile_size`, `logfile_perms`, and `logfile_retention`. Thus, you can configure the logs as dated files with retention controls instead of the common wrapping pair of `log0` and `log1`. The same rules apply to **storsrvd** as to all other daemons.

You can control the volume of data written to the log files with the `daemon_options` file parameters `log_filter` and `log_level`. For a description of these options, refer to [“Specifying server behavior” on page 163](#).

## Numbered messages issued by storsrvd

The SYMAPI server application-level messages are distinguished from messages issued by the Solutions Enabler common daemon support by the use of a messages identifier. The complete set of **storsrvd** messages is documented in [Appendix A](#).

The following `daemon_options` file keywords affect the appearance of the **storsrvd** messages:

- ◆ `log_show_category` displays or suppresses the category (also known as the filter) that applies to a message.
- ◆ `log_show_msgid` displays or suppresses the message identifier in the message.

For a description of these options, refer to [“Specifying server behavior” on page 163](#).

# CHAPTER 5

## Post-Install for z/OS

Once you have installed Solutions Enabler, you need to perform certain follow-up procedures to enable your software's features and to establish your command environment. This chapter provides the follow-up procedures for a Solutions Enabler installation in a z/OS mainframe environment:

- ◆ SYMAPI server security preparation ..... 172
- ◆ Configuring Solutions Enabler ..... 173
- ◆ Remote control operations ..... 178
- ◆ Controlling the server ..... 181
- ◆ Running the base daemon on z/OS ..... 185
- ◆ Running the event daemon on z/OS ..... 186

## SYMAPI server security preparation

This section explains how to control access to the SYMAPI server.

### Started task user identity

The SYMAPI server is installed to be run as a batch job, but you can also customize it to run as a started task.

If you choose to run the server as a started task, you must associate a user identity with it. You can assign a user identity to the server using the `RDEFINE` command or the started task table `ICHRIN03`. An example of the `RDEFINE` command is shown below assigning the user `SEMAGENT` to all started tasks whose names start with `SEMAGENT`:

```
RDEFINE STARTED SEMAGENT.* UACC(NONE) STDATA(USER(SEMAGENT))
OWNER(SYS1)
```

If you use the `ICHRIN03` table to associate started task names with user identities, refer to the IBM publication *Security Server RACF System Programmer's Guide* for details on preparing this table.

### Installing SSL certificates

Solutions Enabler optionally allows the use of SSL encrypted communications between the SYMAPI server and the clients connecting to it. You can configure the server to allow client sessions without SSL, or to require SSL sessions. Client configuration to use SSL or not must match the server configuration.

If you plan on using the optional SSL encrypted communications and you plan on running the server in `SECURE` or `ANY` modes, you must create and install the SSL certificates before starting the server.

---

**Note:** For information on configuring the security level on the server side, refer to the *EMC VMAX Family Security Configuration Guide*.

---

---

**Note:** You must have run job `#07DFLTS` before the following steps can be taken. Job `#07DFLTS` creates requisite directories in the UNIX System Services filesystem.

---

To install SSL certificates into the certificate store created by the `#07DFLTS` job, you must visit the Windows machine where you initiated the z/OS installation, and then follow these steps:

1. Change to the temporary directory where you ran the `uploadse.bat` command.
2. Run the batch file `zoscercert.bat` with the `create` parameter in the temporary directory you created on the Windows host in [“Step 1: Copy the files” on page 69](#).

For example:

```
zoscercert create
```

---

**Note:** The `zoscercert.bat` script requires that the Microsoft Visual Studio 2012 redistributable runtime library is installed. If this library is not installed, it will be automatically installed as part of the certificate generation process. The library will not

be removed after the installation is complete. If you wish to remove the runtime library after successfully generating the certificate, you can do so by using the **Add or Remove Programs** function from the Windows Control Panel.

3. When prompted, provide the following information:

- The fully qualified name of the z/OS host (hostname including the domain name). This is the same name as you specified when running the `uploadse.bat` command.

---

**Note:** In the case of multi-homed hosts, more than one fully qualified hostname may be specified, separated by spaces, in response to the prompt for the hostnames. If you enter more than one hostname at the host prompt, the first name will be used as the Common Name in the certificates, and all names after the first are used in the Subject Alternative Names. You may specify IP addresses in addition to host names for either the Common Name or Subject Alternative Names. The first name entered is also the target address of the FTP command used to send certificates to the mainframe.

- The FTP port number (default 21) of the z/OS host.
- The z/OS userid for sign in to the FTP service on the mainframe. The user must have write permission to the SYMAPI base directory and all subdirectories.
- The SYMAPI base directory (specified when running the SEMJCL exec on z/OS).
- The password for the z/OS userid.

Once generated, the certificates will be uploaded to the correct location inside the Unix System Services file system on the z/OS host. For example, if you specified the SYMAPI base directory as `/var/symapi`, the certificates will be uploaded to the directory `/var/symapi/config/cert`.

The certificate configuration is now complete and the server is capable of running in a secure mode.

---

**Note:** For more information on certificate management, refer to the *EMC VMAX Family Security Configuration Guide*.

## Configuring Solutions Enabler

This section explains how to configure Solutions Enabler in a z/OS environment.

### SYMAPI database support

Solutions Enabler for z/OS supports the SYMAPI database and all the associated access modes. Solutions Enabler will refer to the database (or create one if it doesn't exist) in the `symapi_installation_directory/db` directory in Unix System Services.

A SYMAPI application can specify the database by providing a name associated with the database using the following formats:

```
/path/to/db.file
```

where:

*/path/to* is a valid, existing, writable Unix System Services path and *db.file* is the name of the SYMAPI database.

Solutions Enabler uses the following conventions to identify the database that it will associate with a particular session. The SYMAPI application specifies the database name in the `SymInit()` function call:

- ◆ As the database default name (by specifying NULL in the database argument)
- ◆ With an explicit database name

---

**Note:** If an explicit location is specified for the database, SYMAPI will use it; otherwise, specifying just a filename will result in the file being stored in the *symapi\_installation\_directory/db* directory.

---

## Server default database locking

The default database is described in the fully qualified Unix System Services path of the database. When a session requests the default database, SYMAPI attempts to use the fully qualified Unix System Services path, handling locking for read-only and read/write sessions appropriately. If the session obtains database locks successfully, SYMAPI loads the database for the session in the mode (read-only, or read/write) desired.

Multiple users can share a database file in a read-only and read/write mode. Write integrity to the database is guaranteed by internal locking mechanisms. No two sessions can request read/write mode concurrently.

Once a read/write session has been started, the SYMAPI server will prevent multiple read/write sessions by failing to initialize subsequent `SymInit()` requests, or by blocking them until the first read/write session releases the database.

Note that the locking behavior applies to the fully qualified path.

## Gatekeeper devices

The use of *gatekeeper*-defined devices in a VMAX array configuration does not apply to z/OS installations. However, z/OS servers do communicate to the system using a UCB on the first device found in the storage array. The SYMAPI protocol selects the first on-line device as its gatekeeper. It is possible that this auto-select mechanism may not always be appropriate. For example, you may not want to have the system paging device or a JES SPOOL volume selected as the communication portal. The high I/O rate produced from the SYMAPI may adversely affect system performance. To control gatekeeper use by the SYMAPI server tasks, you can define specific devices to be used as gatekeepers, and also specify devices to be avoided as gatekeepers.

---

**Note:** For more information on gatekeepers, refer to [Chapter 7](#). For more information on specifying devices to use/avoid from using as gatekeepers, refer to [“Avoidance and selection files” on page 175](#).

---

## SYMAPI files

[Table 34](#) lists and maps the SYMAPI files to corresponding DD statements. It also shows which files can be defined in PARMLIB members or in datasets, and which files can optionally be defined in Unix System Services files.

**Note:** For Unix System Services supported files, SYMAPI will only use a Unix System Services location if the corresponding DD name is not specified in the SYMAPI server JCL (comment it out or delete it).

**Table 34** SYMAPI files

DD name	File type	Description
SYM\$LIC	Unix System Services	An input file for the Solutions Enabler license information. Unix System Services: <i>symapi_installation_directory/config/symapi_licenses.dat</i>
SYM\$OPT	Unix System Services	The SYMAPI options file. For more information, refer to <a href="#">“Changing the default behavior of SYMCLI” on page 115</a> . Unix System Services: <i>symapi_installation_directory/config/options</i>
SYM\$ENV	PARMLIB, Dataset	Contains the C runtime environment variables. This file must be either a sequential dataset or a member of a partitioned dataset. This file must only be used with the direction of the EMC Customer Support Center. PARMLIB: <i>ds-prefix.PARMLIB (symenv00)</i>
SYM\$NETH	Unix System Services	Defines a list of trusted hosts and users who are allowed to connect to the server. For more information, refer to the <i>EMC VMAX Family Security Configuration Guide</i> . Unix System Services: <i>symapi_installation_directory/config/nethost</i>
SYSOUT	Spool	Contains IBM Language Environment runtime messages.
SYSPRINT	Spool	Contains summary log output and output produced by the use of debugging controls.

## Avoidance and selection files

[Table 35](#) lists the these files in the UNIX file system.

**Note:** From V7.6, Solutions Enabler no longer supports avoidance and selection files in JCL. Non-configuration specific files (such as SYM\$ENV) that are unique to z/OS, and have no Unix System Services equivalent are still supported via JCL.

Should an unsupported DD statement be used, Syminit will fail with the error SYMAPI\_C\_FILE\_TYPE\_NOT\_SUPPORTED.

These files can be used to customize and streamline command line coding for your specific environment.

These are editable files with device names or array IDs that you use to limit the effect of commands to include or exclude the specified devices, gatekeepers, or VMAX arrays. The files hold either volume serial names (*volser*) or array IDs (*Symmids*) with line entries having only one device name or ID per line. Lines beginning with a # (comment) are ignored.

**Table 35** Solutions Enabler avoidance and selection files (page 1 of 2)

DD name	File type	Description
SYM\$AVD	Unix System Services only	<p>JCL DD statement is not supported.</p> <p>For example, to avoid discovery of the storage array with a serial number of 0000183600186, code the serial number in the following file:            Unix System Services:  <i>symapi_installation_directory/config/symavoid</i></p> <p>This file affects the operation of the discovery process so that it skips devices that belong to the VMAX arrays identified in this file. This may be useful if there are multiple VMAX arrays connected to the host that you wish the discovery to avoid. The avoidance file is formatted with 12-character array IDs, with one ID per line.</p>
SYM\$INQ	Unix System Services only	<p>JCL DD statement is not supported.</p> <p>For example, to include information on volume ABC123 (only) and the array to which it is attached, code the volume serial number in the following file:            Unix System Services:  <i>symapi_installation_directory/config/inqfile</i></p> <p>This file affects the inquiry and discovery processes so that they find only the volume serial name (<i>volser</i>) specified in this file. This maybe useful if you want to limit the command(s) to affect only certain VMAX array devices from your host. The inquiry file is formatted with volume serial names (<i>volser</i>), with one <i>volser</i> per line.</p>
SYM\$GAVD	Unix System Services only	<p>JCL DD statement is not supported.</p> <p>For example, to instruct Solutions Enabler for z/OS to avoid using volume DEF456 as a gatekeeper device, code its serial number in the following file:            Unix System Services:  <i>symapi_installation_directory/config/gkavoid</i></p> <p>This file affects calls to commands that use a gatekeeper to communicate to a VMAX array. A gatekeeper whose <i>volser</i> matches any of the entries specified in the <i>gkavoid</i> file will not be chosen as a gatekeeper to communicate with the VMAX array. This could be useful to designate certain VMAX array devices that should not be used as gatekeepers. The gatekeeper avoidance file is formatted with volume serial names (<i>volser</i>), with one per line.</p>

**Table 35 Solutions Enabler avoidance and selection files (page 2 of 2)**

DD name	File type	Description
SYM\$GSEL	Unix System Services only	<p>JCL DD statement is not supported.</p> <p>In SYM\$GSEL, specify serials for the volumes you prefer to be gatekeepers. Specify one volume serial per line, with no other text on the line.</p> <hr/> <p><b>Note:</b> If a SYM\$GSEL list is not defined for a particular VMAX array or if the specified volumes to do not exist at the time the file is read (every time a CLI command is run), then normal gatekeeper selection rules will apply for that storage array.</p> <hr/> <p>If you specify a volume serial in both the SYM\$GAVD and the SYM\$GSEL, the entry in SYM\$GAVD takes precedence. Thus, SYM\$GSEL creates a limited list of candidate gatekeepers, and SYM\$GAVD further restricts the list by removing volumes from the candidate list.</p> <p>If you specify a gatekeeper selection list in SYM\$GSEL, be sure to specify at least one volume on each system you want to access through Solutions Enabler. For example, to instruct Solutions Enabler to give preference to volumes GHI123, JKL123 and MNO123, code their serial number in the following file:</p> <p>Unix System Services:  <i>symapi_installation_directory/config/gkselect</i></p> <hr/> <p><b>Note:</b> If you specify a volume in BOTH the SYM\$GSEL and SYM\$GAVD, the entry in SYM\$GAVD takes precedence, effectively removing the volume from the list of potential gatekeepers. Thus, if the volume DEF456 also appeared in SYM\$GSEL, its entry in SYM\$GAVD (see example above) cancels its participation in gatekeeper selection.</p>

## Configuring for local time zone

The SYMAPI server software uses IBM Language Environment runtime library, and must execute with the LE option POSIX(ON). One of the side effects of running with POSIX(ON) is that the local time displays are influenced by the POSIX time semantic definitions. The default behavior defined by POSIX for local time interpretation may not fit your operation.

You can use the TZ environment variable to cause LE to display local time properly. There are several places where time stamps are displayed — the `storsrvd` log files and SYMAPI log file are the most important places. Use the TZ environment variable to establish your local offset from Coordinated Universal Time (UTC). The valid settings for TZ are standardized by the POSIX standard and are described in many publications, including the IBM Language Environment books.

In the PARMLIB member `SYMENV00`, you can set TZ. The sample setting in the distributed member causes the local time zone to be set to United States Eastern Standard Time, offset five hours from UTC (also known as Greenwich Mean Time or GMT), and EDT time may apply. The following example shows the same specification using an Instream dataset set for SYM\$ENV:

```
//SYM$ENV DD *
TZ=EST5EDT
/*
```

In the **Time Zone** field of the SEMJCL panel (4. on page 72), you can enter the appropriate setting for your time zone. “Installing Solutions Enabler on z/OS” on page 69 includes more information.

---

**Note:** Due to the way Language Environment processes a TZ variable passed in by SYM\$ENV, a TZ variable with no DST in the string results in exactly the same time as a TZ variable with DST. For example, the variable MST7 will be processed the same as MST7DST and will have the same resultant time zone.

To workaroud this, for any of the z/OS daemons, the TZ variable should be specified as part of the PARM on the EXEC DD statement. For example:

```
//STORSRVD EXEC PGM=STORSRVD,REGION=0M,
//          PARM='ENVAR(TZ=MST7)'
```

---

## Modifying default behavior with the options file

The `options` file contains statements that can be modified to change the default behavior of SYMCLI operations, SYMAPI calls, and their control actions. It can be used to impart certain global restrictions as well as customize and streamline command line coding to your specific environment. Each sample statement is commented, and can be enabled by removing the # in the first column.

---

**Note:** For descriptions of the `options` file parameters, refer to *EMC Solutions Enabler SYMCLI Command Reference Guide*.

---

## Remote control operations

Remote control operations can be executed by the SYMAPI server on behalf of remote clients such as SYMCLI, or Unisphere for VMAX.

## Restricting remote control operations

Remote control operations are enabled by default. Proceed only if you want to restrict certain remote control operations.

Remote control operations brings convenience but at the same time may also impact user data or system operation negatively. For that reason, you may wish to restrict the use of certain remote operations.

[Table 36](#) lists some of the control operations that can be disabled in the z/OS server.

**Table 36** Examples of z/OS control operations (page 1 of 2)

Function	Action
SymAccessSessionStart	Starts an access control session.
SymAuthzRuleDelete	Maintains internal authorization rules.
SymAuthzRuleUpdate	Updates internal authorization rules.
SymCgControl	Controls Consistency Groups.

**Table 36** Examples of z/OS control operations (page 2 of 2)

Function	Action
SymCgBcvControl	Invokes a BCV control operation affecting all standard devices in a composite group.
SymCgRdfControl	Invokes an RDF control operation affecting all remotely mirrored RDF standard and R1 BCV devices in a composite group.
SymConfigChangeSessionStart	Starts a configuration change session.
SymDevBcvControl	Invokes a BCV control operation on the specified standard device and the specified BCV device.
SymDevControl	Invokes a basic operation on one or all devices that meet a specified selection criteria.
SymDevListBcvControl	Invokes a BCV control operation on a specified list of standard and BCV devices.
SymDevListControl	Invokes a basic operation on a list of devices that meet a specified selection criteria.
SymDevListRdfControl	Invokes an RDF control action on a list of devices.
SymDgBcvControl	Invokes a BCV control operation affecting all standard devices in a device group, which has one or more associated BCV device.
SymDgControl	Invokes a basic control operation affecting all standard, or optionally all BCV, devices in a device group.
SymDgRdfControl	Invokes an RDF control operation affecting all remotely mirrored standard or RDF R1 BCV devices in a device group.
SymDirControl	Invokes a director control operation on one or all SRDF RA directors.
SymDirPortControl	Invokes a port control operation on a front-end director.
SymLdevBcvControl	Invokes a BCV control operation affecting one standard device in a device group, which has one or more associated BCV devices.
SymLdevControl	Invokes a basic control operation on a device in a device group.
SymLdevListBcvControl	Performs a BCV control operation affecting a list of standard devices in a device group.
SymLdevListControl	Executes a basic operation affecting the specified list of standard devices or BCV devices of a group.
SymLdevListRdfControl	Invokes an RDF control operation affecting one remotely mirrored standard device, or one or more RDF R1 BCV devices in a device group.
SymListDevListBcvControl	Invokes a single BCV or Snap control operation on a structure or array.
SymNewCgControl	Invokes a basic control operation affecting devices of a specified type within a specific composite group.
SymNewOptmzrControl	Invokes control operations on the Optimizer.

The control operations can be disabled by executing the job in the #12CNTRL member in the RIMLIB dataset. That job executes the AMASPZAP utility to change entries in a control table. Each entry in the table corresponds to one of the control operations listed above. The comments in the AMASPZAP input indicate the relationship of the zap to the operation.

## Control statements

**Hint:** Make a copy of member #12CNTRL for backup purposes before making any changes.

The entries in the control table are mostly VER statements and REP statements grouped together respectively. A VER or VERIFY statement is composed of the command phrase VER, a hexadecimal address and an eight-byte hexadecimal value. The following is an example:

```
VER 0001D8 0000,0000
```

The VER statement checks to see if the value at the address given is the same as the value provided in the statement. If true, then the following statement will be executed. If not, the following statements will be ignored and job #12CNTRL will quit.

A REP statement is composed of the command phrase REP, a hexadecimal address and an eight-byte hexadecimal value. The following is an example:

```
REP 0001D8 0000,0001
```

The REP statement replace the current value at the given address with the value provided in the statement.

## Modifying the control table

**Hint:** Use the backup copy of the job as a reference.

Job #12CNTRL is customized during the SEMJCL process, but does require a manual edit by the submitter before it can be used because it contains an invalid VER statement to force failure. This VER statement should be commented out or removed:

```
VER 0001D8 READ,DOC COMMENT OUT THIS LINE TO RUN THE JOB
```

This invalid VER statement provides additional protection against accidental disabling of control operations. No change will take place if the job is submitted without making any changes.

Once the invalid VER statement is removed, the first entry in the table provides the capability to enable or disable control operations listed in [Table 36](#) as a whole. The following is how the first VER entry in the control table is configured by default:

```
VER 0001D8 0000,0000 IF ALL 0, CONTROLS ARE ENABLED
```

This statement verifies the value at address 0001D8. If it is 0, that means Solutions Enabler does not check individual control operations. It simply allows all remote control operations.

To enable checking of individual operations, simply find the REP statement with the same address, 0001D8; remove the leading asterisk to uncomment the statement and change the value following the address to 0000,0001.

This effectively disables all control operations because you have just enabled checking of individual operations and all of them are set to disable by default.

To enable selective operations, find the REP statement with the same address as the VER statement for the desired operations, remove the leading asterisk, and change the value of the REP statement to 0000,0000.

For example, if you want to enable remote director control:

1. Find the VER statement for director control using the comment:

```
VER 0001F8 0000,0870 DIRECTOR CONTROL
```

2. Find the REP statement with the address 0001F8:

```
*REP 0001F8 0000,0870
```

3. Remove the leading asterisk to uncomment the statement and change the value from 0000,0870 to 0000,0000.
4. Save job #12CNTRL.

Repeat these steps for each control operation you want to enable.

**⚠ WARNING**

Running multiple iterations of #12CNTRL could get the table into state where there are VERs failing due to prior changes, so plan accordingly by keeping a pristine backup copy of #12CNTRL.

---

## Additional Work

In addition to executing the #12CNTRL member, the SYMAPI\_CTRL\_VIA\_SERVER option can be set to ENABLE or DISABLE. The default value of the option is ENABLE, which corresponds to the #12CNTRL setting.

If you want to enable or disable control operations, you must:

- ◆ Verify that the SYMAPI\_CTRL\_VIA\_SERVER option is set to ENABLE or DISABLE.
- Or
- ◆ Edit the #12CNTRL member in the RIMLIB as previously discussed.

**⚠ CAUTION**

By leaving control operations enabled, you enable open systems users to make changes to the array configuration on your mainframe system.

---

You may undo the changes you made using #12CNTRL by reversing any VER and REP changes and resubmitting the job.

**IMPORTANT**

---

The server will need to be restarted if any #12CNTRL changes are applied.

---

## Controlling the server

You can inspect and control the behavior of the server using the `stordaeomon` command or the system console. For information on the commands accepted by the SYMAPI server, refer to [“Controlling the server” on page 165](#).

This section describes specific methods of entering the commands.

## Starting the server

To start the SYMAPI server, you can submit the job stream contained in the #STORSRV member of the Solutions Enabler RIMLIB for batch execution.

---

**Note:** #STORSRV was customized when you used SEMJCL to specify configuration information appropriate for your site during the installation procedure.

---

You can execute the SYMAPI server program `storsrvd` as a started task. You can prepare a catalogued procedure for use as a started task. No such procedure is provided with the installation kit.

You cannot use `stordaemon start` in the z/OS environment to start the server.

## Stopping the server

To stop the SYMAPI server, you can use the `stordaemon shutdown` command, or the equivalent command from the z/OS system console.

You can also use the z/OS `STOP` command regardless of whether the server is running as a started task or as a batch job. Using the `STOP` command (for example, "`P STORSRVD`") starts a normal shutdown, waiting for all SYMAPI sessions to terminate normally.

## Using the console

You can control the SYMAPI server while it is running by issuing operator commands using the the z/OS system command `MODIFY` (abbreviated `F`):

```
F jobname, command
```

where:

*jobname* is the name of the batch job or started task under which the SYMAPI server is running.

*command* is the text of the command passed to SYMAPI server.

## Usage notes

When issuing commands from the system console, you should be aware of the following:

- ◆ While `stordaemon` commands are sent to the daemons without upper case conversion, text entered on the system console (and all virtualized consoles) is normally folded to uppercase by the operating system. Enclosing the text in apostrophes (not quotes) alters the behavior, resulting in the command text being sent as is to the application.
- ◆ Commands issued using the `stordaemon action verb` must be entered with apostrophes to preserve the case. Complete enclosure in apostrophes is not necessary; a leading apostrophe is sufficient to preserve case. A closing apostrophe will be accepted and ignored.
- ◆ Dashed options are not required. The SYMAPI server allows the specification or omission of the dash on the command options. The console command parsing logic will accept a dash if specified, but ignore it for the purposes of option identification.
- ◆ Commands entered from the console are directed to a specific running daemon. Thus the multi-daemon commands and operands are not supported when entered from the console. The `list` command and the `all` option of the `shutdown`, `setvar`, `getvar` commands are not supported when entered at the console.

- ◆ The daemon name must be omitted in the command text, since the `MODIFY` system command specifies the jobname which directs the command to the correct daemon. Thus, the command text will begin with the verb.
- ◆ The `action` verb can be omitted only if the `-cmd` verb and/or operands can unambiguously distinguish the command from all general commands. For example, in the case of `storsrvd`, the general `show` command will show basic status information. The action `-cmd show` command will show other detailed information specific to `storsrvd`.
- ◆ The `-cmd` option can be omitted also. If either `action` or `-cmd` are specified, the command text will be passed to the running daemon for execution. If the daemon application log parses the command text successfully, it may execute the command and produce the appropriate output. If the application logic does not recognize the command, an error message will be generated and written to the console.
- ◆ Commands that change the environment outside of the daemon will not be accepted from the console. These are `start`, `install`, and `uninstall`.
- ◆ The `-wait` option of the `stordaeomon shutdown` command is not supported and will be ignored if entered from the console.
- ◆ The `showlog` command is not supported from the console.

*Examples* Table 37 compares the syntax of the `stordaeomon` commands issued from a Unix System Services shell to the syntax of the same commands entered on the z/OS console. Assume that the jobname of the server is `STORSRVD`, and the daemon name is also `storsrvd`. Note that the z/OS system command `MODIFY` alias is 'F'.

**Table 37** `stordaeomon` command syntax for the z/OS system console (page 1 of 2)

Command	<code>stordaeomon</code> syntax	Console syntax
Show daemon status long. Show daemon status (state).	<code>stordaeomon show storsrvd</code> <code>stordaeomon show storsrvd -brief</code>	F STORSRVD,SHOW F STORSRVD,SHOW [-]BRief
Stop the daemon.	<code>stordaeomon shutdown storsrvd</code>	F STORSRVD,SHUTDOWN
Stop the daemon immediately.	<code>stordaeomon shutdown storsrvd -immediate</code>	F STORSRVD,SHUTDOWN [-]IMMediate
Show the current value of an operational variable (port in this example).	<code>stordaeomon getvar storsrvd -name port</code>	F STORSRVD,'getvar [-]name port'
Change the current value of an daemon option (takes effect immediately).	<code>stordaeomon setvar storsrvd -name log_filter=SESSION,APIREQ</code>	F STORSRVD,'setvar [-]name log_filter=SESSION,APIREQ'  <b>Note:</b> The <code>-name</code> option can be abbreviated to 3 chars and the dash can be omitted.

**Table 37** stordaemon command syntax for the z/OS system console (page 2 of 2)

Command	stordaemon syntax	Console syntax
Store a new value of a daemon option for reload or subsequent execution. In this example, change the port to 2708.	stordaemon setoption storsrvd -name port=2708	setoption is not supported from the console in this release.
Issue a <code>storsrvd</code> extending action. In this example, show details for SYMAPI session number 4.	stordaemon action storsrvd -cmd show -session -num 4	F STORSRVD,'action show -ses -num 4 <b>Note:</b> In this example the <code>-cmd</code> keyword is omitted, and a closing quote is also omitted.
Show network information.	stordaemon action storsrvd -cmd show -netinfo	F STORSRVD,'action show -netinfo'

In general, command-generated output shown on the z/OS console will suppress blank lines for the sake of brevity and to reduce messages rolling off the console screen.

## Using stordaemon TSO commands

In the TSO command shell, the `stordaemon` command operates as it does on all platforms. If the Solutions Enabler load library is in the TSO STEPLIB or CMDLIB, you can issue the `stordaemon` command as shown in the following example:

```
IKJ56455I USER1 LOGON IN PROGRESS AT 13:33:01 ON APRIL 1, 2015,
IKJ56951I NO BROADCAST MESSAGES,
REXX/SOCKETS z/OS V1R6 January 5, 2007,
READY
```

```
STORDEMN show storsrvd
<output will show here>
```

```
CALL 'EMC.SSEM803.LOADLIB(STORDEMN)' 'show storsrvd'
<output will show here>
```

Optionally, you can trap all output of the `stordaemon` command with the REXX language function `outtrap()`. In which case, all output will be saved in a REXX variable array, where it can be processed programmatically.

## Using stordaemon in a Unix System Services shell

The following example illustrates how you can configure `stordaemon` to run from Unix System Services. For the sake of this example, assume that you have already logged in to the z/OS Unix System Services shell either via `rlogin` or the TSO `OMVS` command:

```
$ cd /var/symapi
$ mkdir bin
$ cd bin
$ ln -e STORDEMN stordaemon
$ export STEPLIB=EMC.SSEM803.LOADLIB
$ stordaemon show storsrvd
$ stordaemon shutdown storsrvd
```

In the example, the user makes an external link from a Unix System Services file to the Solutions Enabler load library module. By setting the STEPLIB environment variable, the shell follows the link from the Unix System Services file to the load library, finding the member stored there. The load library member executes the `stordaeomon` application. Any z/OS supported `stordaeomon` functions can be used in this environment.

## Running the base daemon on z/OS

As the base daemon (`storapid`) is required for almost every z/OS SYMAPI server service, it should be running at all times. The base daemon provides numerous benefits for the z/OS environment, including improved performance and enhanced array lock management.

Most of the information in this section is similar to the daemon information described in [Chapter 3](#); however, this section describes it from the z/OS point of view.

### Starting the base daemon

Once the SYMAPI server is running, start the base daemon by submitting the job `#STORAPI` in the RIMLIB. This job will have been correctly configured when the SEMJCL process was run. If necessary, you can modify this job and convert it to run as a started task. You cannot use the `stordaeomon` command to start the base daemon.

---

**Note:** As there is no watchdog daemon in z/OS, the base daemon will not automatically start/restart.

---

### Stopping the base daemon

[Table 38](#) lists the commands for stopping the base daemon.

**Table 38** Commands for stopping the base daemon

From	Use the command
Console	F STORAPID,SHUTDOWN
TSO	stordemn shutdown storapid
Unix System Services shell	stordaeomon shutdown storapid

For more information on using these methods, refer to [“Controlling the server” on page 181](#).

### Using and configuring the base daemon

The base daemon behavior is determined by parameters set in the configuration file `daemon_options`. This file is found in the `symapi_installation_directory/config` folder. It is a standard text file that you can edit by way of `oedit` or any other text editor. For detailed information on editing the parameters in this file, refer to [“Controlling daemon behavior” on page 120](#).

By default, if the base daemon is running, then the z/OS SYMAPI server will connect to it and use its features. If it is not running, then the server will not attempt to start or use it.

## Base daemon logging

Solutions Enabler daemons all use a common infrastructure mechanism for logging messages and events. For information on the options available to manage the way the base daemon uses its log files, refer to [“Controlling daemon logging” on page 121](#).

## Avoidance and selection files and the base daemon

The base daemon will not recognize or use JCL specified selection and avoidance files. It will only use the appropriate files in the *symapi\_installation\_directory/config* folder in Unix System Services.

You should not use both MVS datasets (for the server) and Unix System Services files (base daemon) for these selection and avoidance files. Doing so will likely result in inconsistent definitions and confusion. If you use the base daemon, you should place the avoidance and selection files for both the SYMAPI server and the base daemon in the relevant Unix System Services location. For the SYMAPI server, the relevant DDnames in the job should be removed or commented out, so that the server will refer to the correct files in Unix System Services.

For more information on the avoidance and selection files, refer to [“Avoidance and selection files” on page 175](#).

## Running the event daemon on z/OS

The use of the event daemon (*storevtd*) is optional for the z/OS SYMAPI server. For information regarding the event daemon, refer to [“Setting up the event daemon for monitoring” on page 124](#).

In the z/OS context, the event daemon is primarily used to enable monitoring capabilities on behalf of other clients. The only client expected to use the event daemon is EMC Unisphere for VMAX.

## Starting the event daemon

Once the SYMAPI server is running, start the event daemon by submitting the job #*STOREVT* in the RIMLIB. This job will have been correctly configured when you ran the SEMJCL process. If necessary, you can modify this job and convert it to run as a started task. You cannot use the *stordaeomon* command to start the event daemon.

---

**Note:** As there is no watchdog daemon in z/OS, the event daemon will not automatically start/restart.

---

## Stopping the event daemon

Table 39 lists the commands for stopping the event daemon.

**Table 39** Commands for stopping the event daemon

From	Use the command
Console	F STOREVTD,SHUTDOWN
TSO	stordaeomon shutdown storevntd
Unix System Services shell	stordaeomon shutdown storevntd

For more information on using these methods, refer to [“Controlling the server” on page 181](#).

## Using and configuring the event daemon

The event daemon behavior is determined by parameters set in the configuration file `daemon_options`. This file is found in the `symapi_installation_directory/config` folder. It is a standard text file that you can edit by way of `oedit` or any other text editor. For detailed information on editing the parameters in this file, refer to [“Controlling daemon behavior” on page 120](#).

## Event daemon logging

Solutions Enabler daemons use a common infrastructure mechanism for logging messages and events. For information on the options available to manage the way the event daemon uses its log files, refer to [“Controlling daemon logging” on page 121](#).

The z/OS Event Daemon supports two logging targets, namely *syslog* and *system*.

### syslog

The *syslog* target routes event messages to a UNIX style syslog daemon (*syslogd*).

---

**Note:** This is a syslog daemon supporting the protocols as defined by RFC 5424 - The Syslog Protocol.

---

The following are examples of messages logged from an Event daemon on a z/OS host to a Linux on System z syslog daemon:

```
Feb 13 10:58:04 sys1 EMCstorevntd: [fmt=evt] [evtid=1234] [date=2011-10-13T14:58:04Z]
[symid=000000000001] [sev=info] = Snap session created, activated or deleted.
Feb 13 10:58:07 sys1 EMCstorevntd: [fmt=evt] [evtid=1201] [date=2011-10-13T14:58:07Z]
[symid=000000000001] [sev=normal] = Array state has changed to Online.
Feb 13 11:01:07 sys1 EMCstorevntd: [fmt=evt] [evtid=1234] [date=2011-10-13T15:01:07Z]
[symid=000000000001] [sev=info] = Snap session created, activated or deleted.
```

The message text is prefixed with the originating host name `sys1` as well as the string `“EMCstorevntd:”`.

### system

The *system* target sends event messages to the z/OS system hardcopy log.

These event messages are routed to the hardcopy log only and not to operator consoles (i.e., they are suppressed). They can be routed to the hardcopy log only on the same z/OS system on which the Event Daemon is running

The following messages are also seen in the Event Daemon joblog. Messages written to the z/OS system log are generally in the format:

```
SYS1      11291 11:41:03.72 JOB06676 00000290  SEEVT00001201  <14>  <fmt=evt> <evtid=1201> ...
```

Where the message ID has the prefix `SEEVT` followed by an eight-digit event ID suffix. These event IDs suffixes correspond to documented Event Daemon event IDs and they are the same number as seen in the `evtid=nnnn` keyword in the message text. However, they are prefixed with sufficient zeros so as to make the SEEVT message ID suitable for automation handling via MPF or a similar tool. The numeric portion of the SEEVT message id will always be eight digits long.

---

**Note:** [“Event message formats” on page 136](#) describes the formats of event messages in detail.

---

# CHAPTER 6

## Technical Notes and Configuration

This chapter provides technical notes for advanced configuration of Solutions Enabler, VSS Provider, and SMI-S Provider.

- ◆ Hyper-V technical notes..... 204

# Solutions Enabler technical notes

## Changes to default port flag settings

The default port flag settings have been updated in Enginuity 5875 and higher. The new default values should simplify the array installation and minimize changes required at install time. [Table 40](#) lists host environments and identifies the environments that require changes to the default port flag settings. Port flag settings can be updated using the `symconfigure` command.

**Table 40** Port settings by operating environment

Operating environment	Port settings
EMC Celerra	Enable ARB and D flags
IBM AIX	5875 defaults unchanged
IBM i	Enable AS4 flag
Linux	Enable D flag
Hewlett-Packard OpenVMS	Enable OVMS flag
Hewlett-Packard HP-UX 11i V1 and V2	Enable V flag, disable SC3 and OS07 flags
Hewlett Packard HP-UX 11i V3	Enable V flag, disable SC3 flag
Microsoft Windows Server 2003	5875 defaults unchanged
Microsoft Windows Server 2008	5875 defaults unchanged
Oracle Solaris	5875 defaults unchanged
VMware ESX	5875 defaults unchanged

In addition, the following special configurations require changes to the new default port flag settings:

- ◆ Environments that directly connect servers to the array—not using switches or other SAN components—using Fibre-Channel Arbitrated Loop (FC-AL) require the PP flag to be disabled and a Loop ID assigned to a particular number ranging from 0-126.
- ◆ Environments that contain Fujitsu (Formerly Siemens), Novell Netware, or Teradata systems, should refer to the EMC support matrix at [www.emc.com](http://www.emc.com) for specific recommendations.
- ◆ The VMAX array is configured by default with the ACLX flag enabled. This requires the masking of specific devices to specific ports on the array. You must provision ACLX volumes to enable host management using Solutions Enabler.

Existing scripts should be tested to ensure compatibility with the new default port flag settings.

---

**Note:** Some of these new default values are different from earlier Engenuity settings. Connecting a host to arrays running Engenuity 5875 and arrays running an early Engenuity version may require changes to the 5875 defaults. Alternatively, you can set the flags at the initiator to match the previously installed array with its existing connection to the server. Changes to flag settings become effective after rebooting the host.

---

## Parallel Access Volumes

From DMX-3, DMX-3 950, DMX-4, DMX-4 950 and higher, both Dynamic Parallel Access Volumes and Hyper Parallel Access Volumes use a pool of aliases for the Control Unit image. Aliases are not dedicated to specific devices and they do not appear in the device specific Aliases column of the `symcfg show -cuimage` command.

## SIU support for ESX Server V4.0

The Symmetrix Integration Utilities (SIU) supports VMware ESX Server V4.1 Update 1.

## Access Control setup

Use of the Symmetrix Access Control feature requires the help of EMC Customer Service to initially set up your array. For more information, contact your EMC Representative and refer to *EMC Solutions Enabler Array Management CLI User Guide* and *EMC VMAX Family Security Configuration Guide*.

---

**Note:** The Solutions Enabler (`symacl`) command provides full support for open systems. Access Control can be enforced for SYMAPI-based applications on z/OS platforms. However, z/OS and IBM i cannot be used as the Access Control administration node.

---

---

**Note:** CREATEDV access can only be granted to ALL devices or on !INPOOLS when there are no accpools defined.

---

When host access IDs are tied to the host hardware, (refer to Alternate access ID earlier) upgrading or changing hardware components might result in a change to the host access ID. For information about changing a host's Alternate access ID, see the *EMC VMAX Family Security Configuration Guide*.

### Solutions Enabler access control requirements

If Solutions Enabler Access Control is enabled on the VMAX array, then the host on which the SMI-S Provider is running must have sufficient privileges to perform the necessary operations. At a minimum, the host on which the SMI-S Provider is running must be in a group that has access to ALL\_DEVS with BASE and VLOGIX privileges.

## Solutions Enabler Windows 2008 configuration requirements

Solutions Enabler supports Windows 2008 and requires some additional configuration due to changes in Windows permissions.

The Solutions Enabler SYMCLI binaries require that the user executing them have write access to the following folders:

- ◆ C:\Program Files\EMC\SYMAPI\db
- ◆ C:\Program Files\EMC\SYMAPI\log
- ◆ C:\Program Files\EMC\SYMAPI\ldb

These folders are created during the Solutions Enabler installation and inherit permissions from C:\Program Files. On most platforms, the resulting ACLs on these folders will grant write privileges to the Administrators Group.

Using Windows Server versions prior to Server 2008, any member of the Administrator's Group can execute the SYMCLI binaries. Using Windows Server 2008, and its User Access Control (UAC), only the built-in Administrator is by default granted Administrative privileges.

Other members of the Administrator's Group will run in a degraded mode—as an ordinary User—and therefore cannot execute the SYMCLI binaries. As a result, there are several options for running Solutions Enabler binaries on Windows Server 2008:

- ◆ Log in as the built-in Administrator. This account may have been disabled by a Systems Administrator when Windows Server 2008 was installed.
- ◆ Log in using a different account and temporarily elevate your privileges to run as a full Administrator. For example, right-mouse-click on the `CMD.EXE` command icon and select **Run as administrator** from the menu. This will open a command shell running with full administrative privileges.
- ◆ Change the protection on the folders listed above to grant write access to the users you want executing Solutions Enabler binaries.

## CQL support statements

The SMI-S Provider supports CIM ExecQuery operations using CQL statements. The performance and scalability of these CQL operations can vary widely depending upon the type and scope of the query being used along with the number of objects that must be evaluated in order to return a result. If you intend to use CQL queries as part of your application, please contact EMC through normal customer support channels with a list of your CQL queries so that they can be evaluated.

In compliance with the CQL Specification, the syntax for the “not equal” operator is “<>”. If your client application uses “!=”, it must be modified to be in compliance with the CQL specification. For example, below is a compliant CQL query using the “not equal” operator:

```
select * from CIM_StorageVolume where CIM_StorageVolume.Usage <> 2
```

# VSS Provider technical notes

## Enable debugging for VSS Provider

To enable debug logging for VSS Provider on a given host, perform the following steps:

1. Select **Run** from the Windows **Start** menu, type `regedit` in the Open selection window, and click **OK**. This opens the Registry Editor.
2. Select the following registry key from those listed:

`HKEY_LOCAL_MACHINE\Software\EMC\ShadowCopy`

**Note:** The `EMCVssProvider` service must have been previously started and a snapshot attempted for a key to exist in the list.

3. Change the **LogLevel** value from `Error` to `Debug`.
4. Close the `regedit.exe` program.
5. Stop and restart the **EMCVssProvider** and **VolumeShadowCopyService** services.

## Log file

By default, VSS Provider writes all errors and notable information messages to a log file (`hwprov.log`) located in the Solutions Enabler log folder (`C:\Program Files\EMC\SYMAPI\log`). This file provides necessary information for troubleshooting operations of VSS Provider.

**Note:** To change the location of the VSS Provider log file, edit the Log file registry key located in the `HKEY_LOCAL_MACHINE\Software\EMC\ShadowCopy` directory.

## Registry keys

Table 41 lists the VSS Provider registry key fields and the possible values.

**Table 41** VSS Provider registry key values (1 of 3)

Name	Type	Value/location
RemoteSnapshotsOnly	REG_SZ	Possible values include: TRUE = Enables creation of remote snapshots only. FALSE = EMC VSS Provider defaults to local snapshots if both are available. Default value = FALSE Location = HKEY_LOCAL_MACHINE\Software\EMC\ShadowCopy
EnforceStrictBCVPolicy	REG_SZ	Possible values include: TRUE = Indicates that EMC VSS Provider enforces a strict BCV rotation policy, where a BCV should only be used if it is not currently part of a snapshot. FALSE = Indicates that EMC VSS Provider does not enforce a BCV rotation policy, leaving enforcement to the VSS requestor. Default value = FALSE Location = HKEY_LOCAL_MACHINE\Software\EMC\ShadowCopy

**Table 41 VSS Provider registry key values (2 of 3)**

Name	Type	Value/location
EnforceMappedDevPolicy	REG_SZ	Possible values include: TRUE = Indicates that EMC VSS Provider selects a target device if it is mapped to any front-end director. FALSE = Indicates that EMC VSS Provider does not need to look for a mapped/unmapped device. Default value = FALSE Location = HKEY_LOCAL_MACHINE\Software\EMC\ShadowCopy
SymmetrixStaticMount	REG_SZ	Possible values include: TRUE = The provider does not remove the target device from the host while taking the snapshot. When deleting a snapshot, the target device is not removed from the host. FALSE = When creating or deleting a snapshot, the target device is removed from the host, that is, LUN masking is performed. Default value = FALSE Location = HKEY_LOCAL_MACHINE\Software\EMC\ShadowCopy
EnforceDefaultToClone	REG_SZ	Possible values include: TRUE = The provider uses TimeFinder Clone as default plex snapshot. FALSE = The provider does not use TimeFinder Clone as default plex snapshot. Default value = FALSE Location = HKEY_LOCAL_MACHINE\Software\EMC\ShadowCopy
RetainCloneSession	REG_SZ	Possible values include: TRUE = Indicates that EMC VSS Provider should enforce a clone retention policy, where a clone session is retained after snapshot deletion for later incremental backups. FALSE = Indicates that EMC VSS Provider does not enforce the clone retention policy, leaving enforcement to the VSS requestor. Default value = FALSE Location = HKEY_LOCAL_MACHINE\Software\EMC\ShadowCopy
EnforceVPSnap	REG_SZ	Possible values include: TRUE= The provider will look for VP snap replicas as default differential snapshot. FALSE= The provider will look for Snap replicas for differential snapshot. Default value = FALSE Location = HKEY_LOCAL_MACHINE\Software\EMC\ShadowCopy
RetainVPSnapSession	REG_SZ	Possible values include: TRUE = Indicates that VSS Provider should enforce a VP Snap retention policy, where a VP Snap session is retained after snapshot deletion for later incremental backups. FALSE = Indicates that VSS Provider does not enforce the VP Snap retention policy, leaving enforcement to the VSS requestor. Default value = FALSE Location = HKEY_LOCAL_MACHINE\Software\EMC\ShadowCopy

**Table 41 VSS Provider registry key values (3 of 3)**

Name	Type	Value/location
EnforceTimeFinderVX	REG_SZ	Possible values include: TRUE = indicates that VSS Provider will look for SnapVX replicas (for plex or differential snapshots). FALSE = indicates that VSS Provider will not look for SnapVX replicas. Default value = FALSE Location = HKEY_LOCAL_MACHINE\Software\EMC\ShadowCopy
SelectVXTarget	REG_SZ	Possible values include: TBCV = indicates that VSS Provider will select Thin BCV device as SnapVX snapshot target if a valid device is available in the device group. TDEV = indicates that VSS Provider will select Thin data device as SnapVX snapshot target if a valid device is available in the device group. ANY = indicates that VSS Provider will select Thin BCV device first (followed by Thin data device if required) as SnapVX snapshot target if a valid device is available in the device group. Default value = ANY Location = HKEY_LOCAL_MACHINE\Software\EMC\ShadowCopy
RetainVXTarget	REG_SZ	Possible values include: TRUE = indicates that VSS Provider should enforce SnapVX retention policy, where same VX snapshot target is retained for incremental backups later. FALSE = indicates that VSS Provider does not enforce SnapVX retention policy. Default value = FALSE Location = HKEY_LOCAL_MACHINE\Software\EMC\ShadowCopy
VXTimeToLive	REG_SZ	Possible values are between 1 to 400 days (both 1 and 400 included). VXTimeToLive indicates that a SnapVX snapshot is retained for these many number of days when RetainVXTarget is set to TRUE. If RetainVXTarget is set to FALSE, VXTimeToLive is ignored. Default value=1 Location = HKEY_LOCAL_MACHINE\Software\EMC\ShadowCopy
SymmetrixSnapPoolName	REG_SZ	SymmetrixSnapPoolName indicates the name of snap pool to be used for TimeFinder Snap (on Enginuity 5876). This name can be a maximum of 32 characters. If this key is not set, TimeFinder Snap uses the default snap pool name. Location = HKEY_LOCAL_MACHINE\Software\EMC\ShadowCopy

VSS Provider V8.0.2 does not support the following registry keys:

- ◆ EnableCloneEmulation
- ◆ EnableMultiVirtualSnap
- ◆ SymmetrixBypassSync
- ◆ ClariionStaticmount (No CLARiON support)
- ◆ CreateFriendlyName (No CLARiON support)

---

**Note:** If changes are made to any of the registry key values listed in [Table 41 on page 193](#), the `EMCVssProvider` service must be stopped and restarted for the changes to take effect.

---

## Remote snapshots

VSS Provider supports both local and remote (SRDF) snapshots on VMAX arrays. If both local and remote target devices are available, VSS Provider defaults to local snapshots. To force VSS Provider to create a remote snapshot, set the `RemoteSnapshotsOnly` registry key as shown in [Table 41 on page 193](#).

## Enforcing a strict BCV rotation policy

As noted in [Table 41 on page 193](#), if the `EnforceStrictBCVPolicy` is enabled, the policy has the following effects on the snapshot process:

- ◆ To support a snapshot for a given BCV, the BCV must be in one of the following states: Synchronized, SyncInProgress, or Not Ready.
- ◆ Once the snapshot is created (BCV has been split), the BCV returns to a Ready state.
- ◆ After the snapshot is deleted, the BCV returns to a Not Ready state.

---

**Note:** When Replication Manager is installed, it creates the `EnforceStrictBCVPolicy` parameter settings in the Registry. If Replication Manager is uninstalled, ensure that the parameter setting is removed, as it may interfere with the performance of other applications (such as the TimeFinder/Integration Module).

---

## Enforcing a mapped device policy

As noted in [Table 41 on page 193](#), if the `EnforceMappedDevPolicy` is enabled, the policy has the following effects:

- ◆ To support a snapshot for a TimeFinder Mirror, the provider chooses a mapped target BCV that is in one of the following states: Synchronized, SyncInProgress, or Split.
- ◆ To support a snapshot for a TimeFinder Snap, the provider chooses a mapped target VDEV that is in the Created state, or any mapped VDEV that is part of the same device group.

---

**Note:** In case of single source paired with multiple target devices, VSS Provider selects the first mapped target device if available.

---

## Using SymmetrixStaticMount to disable LUN masking and unmasking

As noted in [Table 41 on page 193](#), if `SymmetrixStaticMount` is enabled, this has following effects during snapshot creation and deletion:

- ◆ Provider will not remove target device from the host while creating the snapshot.
- ◆ During import of the snapshot, Provider will not attempt to add target device to host.
- ◆ Provider will not remove target device from the host while deleting the snapshot.

---

**Note:** To take snapshots with registry key “SymmetrixStaticMount” enabled, it is required that target devices are made visible to the VM or host before the snapshot creation. User should see target devices under Disk Management on Windows Server operating system.

---

## Enforcing TimeFinder Clone as default plex snapshot technology

Installation of VSS Provider creates registry key `EnforceDefaultToClone` with a default value of FALSE.

When the registry key `EnforceDefaultToClone` is set to TRUE, the VSS Provider uses TimeFinder Clone as the default plex snapshot. In this case, snapshot creation with TimeFinder Mirror sessions is not supported.

When the registry key `EnforceDefaultToClone` is set to FALSE (Default), the VSS Provider does not use TimeFinder Clone as the default plex snapshot. TimeFinder Clone operations requires the use of EMC requestors.

## Enforcing a clone retention policy

The clone retention policy is applicable to TimeFinder Clone operations. As noted in [Table 41 on page 193](#), if `RetainCloneSession` is enabled, then the policy has the following effects on the snapshot process:

- ◆ To support a snapshot, the target device must be in one of the following states: Created, Recreated, or Not Ready.
- ◆ Once the snapshot is created, the target device returns to a Ready state.
- ◆ After the snapshot is deleted, the target returns to a Not Ready state.

## Enforcing TimeFinder VP Snap as default differential snapshot technology

To create differential snapshots for VP Snap Sessions, use the `EnforceVPSnap` flag.

When the registry key `EnforceVPSnap` is set to TRUE, the VSS Provider uses TimeFinder VP Snap as the default differential snapshot.

When the registry key `EnforceVPSnap` is set to FALSE (Default), and the `EnforceTimeFinderVX` is set to FALSE (Default), the VSS Provider uses TimeFinder Snap as the default differential snapshot technology.

## Enforcing a VP Snap retention policy

The VP Snap retention policy is applicable to TimeFinder VP Snap operations. As noted in [Table 41 on page 193](#), if `RetainVPSnapSession` is enabled, then the policy has the following effects on the snapshot process:

- ◆ To support a snapshot, the target device must be in one of the following states:  
Created, Recreated, or Not Ready.
- ◆ Once the snapshot is created, the target device returns to a Ready state.
- ◆ After the snapshot is deleted, the target returns to a Not Ready state.

## Enforcing SnapVX as default snapshot technology on HYPERMAX OS 5977

When the registry key `EnforceTimeFinderVX` is set to TRUE, VSS Provider V8.0.2 uses SnapVX as the default snapshot technology. Snapshot context - plex or differential - is specified by VSS requester during backup operation. If no context is specified by requester for SnapVX, VSS Provider uses differential context as default.

When the registry key `EnforceTimeFinderVX` is set to FALSE (default), the VSS Provider does not use SnapVX as the default snapshot technology.

---

**Note:** If registry key `EnforceTimeFinderVX` is set to TRUE, then user must not set `EnforceDefaultToClone` to TRUE or `EnforceVPSnap` to TRUE. This is by design to avoid mixing of these registry keys. VSS Provider will return appropriate error message if these keys are mixed.

---

## LUN resynchronization

VSS Provider supports the LUN Resynchronization (restore) feature for transportable shadow copies that is provided with Microsoft Volume Shadow Copy Service on Windows platforms for VMAX arrays. The LUN Resynchronization feature allows a source LUN to be restored from the destination LUN, in the event that there is data loss on the source LUN. The Diskshadow VSS requestor tool should be used to initiate and perform the resynchronization.

### LUN resynchronization support on VMAX arrays

The following information applies to using the LUN resynchronization feature on VMAX arrays:

- ◆ LUN resynchronization is supported for TimeFinder Mirror, Clone, VP Snap, Snap and SnapVX.
- ◆ For TimeFinder Mirror and Clone, LUN resynchronization is supported to both existing and new LUNs. For this, the new LUN must be a DATA device that is online.
- ◆ For SnapVX, VP Snap and Snap LUN resynchronization is supported to existing LUNs only.
- ◆ On successful LUN resynchronization operations, the devices are in a restored state. The requesting application, or the user, is responsible for termination of the restored session.

## VSF (Veritas Storage Foundation) 5.1 SP1 for Windows

VSS Provider V8.0 no longer supports Veritas Storage Foundation (VSF).

## Windows Server 2008 R2 CSV (Cluster Shared Volumes)

VSS Provider V8.0 supports snapshots of CSV on VMAX arrays. For CSV backup, the requestor used should include Hyper-V writers.

## Windows Server 2012 or 2012 R2 CSV

VSS Provider V8.0 supports snapshots of CSV on VMAX arrays. For CSV backup, the requestor used should include Hyper-V writers.

## Using DPM to back up virtual machines deployed on CSV

When using System Center Data Protection Manager as a requestor application, virtual machines deployed on CSV with VSS Provider can be backed up serially.

---

**Note:** VSS Provider does not support parallel backups.

---

# SMI-S Provider technical notes

## Global mode

These steps must be completed before any replication group operations are initiated.

1. Shut down ECOM service.
2. Shut down Solutions Enabler daemons.
3. In the `SYMAPI/config/options` file add/enable this setting:  
`SYMAPI_USE_GNS = ENABLE`
4. Start ECOM service. ECOM service will automatically start the Solutions Enabler daemons.

## Mirror replication in two-provider configurations

These steps must be completed to enable mirror replication for two-provider configurations:

1. Shut down ECOM service.
2. Shut down Solutions Enabler daemons.
3. In the `<SYMAPI_HOME>/config/options` file add/enable these settings:  
`SYMAPI_USE_GNS = ENABLE`  
`SYMAPI_USE_RDFD = ENABLE`
4. In the `<SYMAPI_HOME>/config/daemon_options` file add/enable this setting:  
`storgnsd:GNS_REMOTE_MIRROR = enable`

5. Start ECOM service. ECOM service will automatically start the Solutions Enabler daemons.

To examine the running daemon, use the `stord daemon list` command.

To stop all of the daemons, use the `stord daemon shutdown all -immediate` command.

To start a daemon, use the `stord daemon start <daemon name>` command.

## Object paths in SMI-S Provider V8.0

The key values of the object path in SMI-S Provider V8.0 are different than the key values of previous SMI-S provider versions. As a result, an object path in SMI-S Provider V8.0 is incompatible with the previous versions, and vice versa.

## CIM interop namespace

The CIM interop namespace for the SMI-S Provider is:

```
interop
```

## Unexpected termination: Windows dump file

SMI-S Provider produces a dump file on the Microsoft Windows platform should the provider terminate unexpectedly.

If an unexpected termination occurs on the Windows platform, a dump file is produced in the `Program Files\EMC\ECIM\ECOM\Providers` directory with the name `ECOM.exe.dmp`. If this occurs, send this file along with the remaining contents of the log directory to EMC Customer Support for analysis.

## Statistics collection interval

By default the Block Server Performance Subprofile collects statistics from an array every 15 minutes once the collection of statistics for that array is initiated. EMC does not support changing that interval to anything less than 15 minutes.

## Logging in with the LDAP user

Use the following format when logging into the ECOM server using LDAP:

```
<domain>\<username>@<ldapserver>  
or
```

```
<username>@<ldapserver>
```

For example, User1 in the ABCDomain attempting to connect to LDAPserver1 should use the following credentials:

```
ABCDomain\User1@LDAPserver1  
or
```

```
User1@LDAPserver1
```

## SMI-S Provider user roles

A role is a predefined set of permissions, or access types, that determine the operations a user can perform. Roles are predefined in SMI-S Provider and cannot be modified. The following list details the user roles defined in SMI-S Provider along with the associated privileges and capabilities:

- ◆ Administrator - User will have access to all administrative and storage management interfaces and configuration data.
- ◆ Manager - User will have visibility of all storage system configuration data and will be able to perform all storage management operations.
- ◆ Monitor - User will have visibility of all storage system configuration data, but will not be able to perform any storage management operations.
- ◆ Security administrator - User will only be able to perform SMI-S security tasks and will not have visibility of any storage system configuration data.
- ◆ VM Admin - This role allows a VMware administrator to register a VASA Provider without being provided with SMI-S administrative credentials for ECOM.
- ◆ VM User - This role is deprecated.

## Linux on System z technical note

The following technical notes are specific to the Linux on System z operating environment:

### HBA libraries

To run commands, such as `syminq hba`, version 1.3 (not version 1.4) of the zfcplib HBA library has to be built and installed on the guest.

The IBM developerWorks "Useful add-ons" website documents the building and installation of the zfcplib HBA API library.

After the zfcplib HBA API library is installed, the driver must be loaded into the kernel using the following command:

```
modprobe zfcplib_hbaapi
```

Various releases of Linux on System z have different names for the HBA API library. By default, Solutions Enabler V8.0 uses `/usr/lib64/libzfcplib_hbaapi.so.0`

If this is not the correct library, link `/usr/lib64/libzfcplib_hbaapi.so.0` (using `ln`) to the correct library.

## z/OS technical notes

### Thread dumps in the zOS server

By default, the Solutions Enabler server on z/OS is configured to take thread dumps to spool via Language Environment dynamically allocated files. In the event of a thread crash, these are the issued messages:

```
ANR0222E ConditionHandler invoked on thread 13, writing dump to DD DMP00013
```

```
ANR0223E Dump to DMP00013 is complete; thread 13 will be terminated
```

You might prefer that these thread dumps are not written to spool. To do this, use DD SYM\$ENV in the server's JCL and add this environment variable:

```
SYMAPI_LE_DUMP_LOGDIR = 1
```

Using this variable redirects the dump output to files in the Solutions Enabler Installation log directory. These files will have the same name as seen in the ANR0222E message text. Restart the server after changing the environment variable file.

In the event of a thread crash, the following messages are issued:

```
ANR0222E ConditionHandler invoked on thread 3, writing dump to DMP00003 in SYMAPI log directory
ANR0223E Dump to DMP00003 in SYMAPI log directory is complete; thread 3 will be terminated
```

The log directory contains the thread dump output.

For example:

```
# ls /var/symapi/log
DMP00003
```

## #04DDDEF

Since you will install Solutions Enabler into the same SMP/E zone as the SSCF720 FMID, #04DDDEF will replace temporary and permanent DD definitions in the target and distribution zones. If these DD definitions do not exist, the SMP/E DDDEF REPLACE statement will end with condition code 4, indicating that there was nothing to replace. This is generally expected, and is not an error.

## #05RECEV

The #05RECEV job may end with a return code of 16 if your site default assembler version does not point to IEV90. The SMP/E message is:

```
GIM23401T ** PROGRAM IEV90 WAS REQUIRED FOR SMP/E PROCESSING BUT WAS NOT AVAILABLE.
GIM20501I RECEIVE PROCESSING IS COMPLETE. THE HIGHEST RETURN CODE WAS 16.
```

If this message appears, customize and run the ASMHA job provided in the RIMLIB and then resubmit #05RECEV.

## #12CNTRL

The #12CNTRL job disables control operations which are now enabled by default in Solutions Enabler.

## STEPLIB APF authorization

Since Solutions Enabler needs SCF to run, the SCF link lib must be included in the STEPLIB concatenation for the RMLIB member #STORAPI. The SCF link library must already be authorized for SCF to execute, so if SCF is active, and if the Solutions Enabler load library is APF authorized, the APF requirements for #STORAPI are satisfied.

Note that the SCF link library may also be specified in the system link list or LPA, in which case you may comment out the DD statement that points to the SCF link library.

## Disabling control functions

### ⚠ CAUTION

The #12CNTRL job disables control operations which are now enabled by default in Solutions Enabler.

---

### ⚠ CAUTION

All control functions are enabled by default.

---

All control functions are now enabled when shipped. As control functions are enabled, they will execute in an unprotected state on the z/OS host. For example, control functions allow remote open system hosts/clients to establish and split BCV and SRDF pairs from outside the IBM host. A zap is provided in the RIMLIB (job #12CNTRL). This zap allows these functions to be disabled, should a site determine that it is necessary.

## Security considerations if you do not disable control functions

Use caution when leaving these functions enabled, as security checks are not performed. If security is an issue at your installation, do not leave the control functions enabled. For complete information, refer to the *EMC Solutions Enabler Installation Guide*.

## HP-UX technical note

The following technical note is specific to HP-UX operating environments:

### HP applications link-edited with prior versions of Solutions Enabler

Applications link-edited with Solutions Enabler 7.2.1 or earlier on any HP platform including PA-RISC 64-bit, and HP Itanium, may experience problems. The problem will be seen during initialization with an error message indicating an unresolved symbol has been detected. Refer to Knowledgebase article EMC269976 available on EMC Support.

## OpenVMS technical note

A CLI runtime problem occurs on OVMS 8.4 hosts running on Itanium hardware. This problem only occurs with some CLI commands, such as `symsnap`. The symptom is an error message like this:

```
%DCL-W-ACTIMAGE, error activating image EMC$LIBSTORPDS
-CLI-E-IMAGEFNF, image file not found
```

```
$1$DKA0: [SYS0.SYSCOMMON.] [SYSLIB]EMC$LIBSTORPDS.EXE;
```

The resolution to this problem is documented in EMC Knowledgebase article EMC278037.

## Hyper-V technical notes

By default, SCSI commands are filtered in Hyper-V in Windows Server 2008 R2. In order to use Solutions Enabler in a guest partition, this filtering must be bypassed as recommended in Planning for Disks and Storage article in the Microsoft TechNet Library.

The following PowerShell script, executed from the parent partition will disable filtering for each child partition listed as arguments to the script. The settings are persistent, but will require a restart of the virtual machine to take effect. The script is provided as an example as-is, and includes no validation or error checking functionality.

```
$Target = $args[0]

$VSMManagementService = gwmi MSVM_VirtualSystemManagementService
    -namespace "root\virtualization"

foreach ($Child in Get-WmiObject -Namespace root\virtualization
    Msvm_ComputerSystem -Filter "ElementName='$Target'")
{
    $VMData = Get-WmiObject -Namespace root\virtualization -Query
        "Associators of {$Child}
        Where ResultClass=Msvm_VirtualSystemGlobalSettingData
        AssocClass=Msvm_ElementSettingData"

    $VMData.AllowFullSCSICommandSet=$true

    $VSMManagementService.ModifyVirtualSystem($Child,
        $VMData.PSBase.GetText(1)) |
    out-null
}

```

The following PowerShell script, executed from the parent partition will display the current filtering status of each child partition listed as arguments to the script. The script is provided as an example as-is, and includes no validation or error checking functionality.

```
$Target = $args[0]

foreach ($Child in Get-WmiObject -Namespace root\virtualization
    Msvm_ComputerSystem -Filter "ElementName='$Target'")
{
    $VMData = Get-WmiObject -Namespace root\virtualization -Query
        "Associators of {$Child}
        Where ResultClass=Msvm_VirtualSystemGlobalSettingData
        AssocClass=Msvm_ElementSettingData"

    Write-host "Virtual Machine:" $VMData.ElementName
    Write-Host "Currently ByPassing SCSI Filtering:"
        $VMData.AllowFullSCSICommandSet
}

```

For more information, refer to the *EMC Symmetrix with Microsoft Hyper-V Virtualization* white paper available on EMC Support.

## Hyper-V Server setup

In Hyper-V setups where Solutions Enabler is installed on VMs, the VM names must match the hostnames of the VMs. This ensures that the `syminq` commands on VMs work properly.

## Hyper-V gatekeepers

At least three unique gatekeepers must be assigned to each virtual machine, as a pass-through disk, to provide Solutions Enabler capabilities to each virtual machine. Based on the number of applications running on the guest, more gatekeepers may be required.

For detailed information on gatekeeper management, refer to the *EMC Solutions Enabler Installation Guide*. For specific gatekeeper sizing recommendations for all array configurations, refer to Knowledgebase article EMC255976 available on EMC Support.

## SIU support for Hyper-V guest OS

Symmetrix Integration Utilities now supports Hyper-V guest operating systems on Windows Server 2008 R2 (and above). Refer to [“Hyper-V technical notes” on page 204](#) for details about configuring a Hyper-V environment.

---

**Note:** Only Windows Server editions are supported as Hyper-V guest operating systems.

---

## SIU support for multiple log files

Symmetrix Integration Utilities (SIU) supports multiple log files for concurrent execution of `symntctl` commands. This can be achieved by setting the environment variable `SYMNTCTL_LOGFILE_NAME` to a custom log file name in each command prompt window. Alternatively, if it is set as a system environment variable, SIU will always log all entries into the custom log file specified.

## Virtual Appliance technical notes

### Linux only support when using ovftool

Virtual Appliance deployment using the `ovftool` is supported only on the Linux platform. It is not supported on the Microsoft Windows platform.

### Daemon behavior during import/export operations

To ensure the integrity of persistent data, all active Solutions Enabler daemons will be shutdown during any import/export operation of persistent data. This causes an interruption in the daemon service. The daemons will automatically restart at the end of an import/export operation.

## Login page cursor not focused

After launching the Virtual Appliance from Firefox, the cursor does not default to the **User** field. If you click Alt+Tab, leaving the application and then returning to it, the cursor will be in the **User** field. You can also place the cursor in the **User** field manually. This issue applies to the Firefox browser only.

## Server hostname requirement

For the Virtual Appliance to resolve a hostname, you should only use a fully qualified hostname (as entered in DNS server) while configuring nethosts and ESX Servers (for adding gatekeeper devices).

## SSL certificate generation

The Virtual Appliance generates an SSL certificate (storsrvd - client/server setup) during the initial boot after the IP address is provided, and during every IP change or reboot.

## Gatekeeper devices

The Virtual Appliance will not allow more than 14 gatekeeper devices to be added to the Virtual Appliance. Attempting to add more than 14 gatekeepers returns an error message.

## Host ESX Server configuration

Host ESX Server authentication is validated each time the **GateKeeper Config** tab is selected. If the authentication fails, the Host ESX Server login credentials and hostname information will be removed from Virtual Appliance records and must be added again.

## SMC daemon service

When SMC daemon service is shutdown from the vApp Manager, the user is logged out of the Virtual Appliance and the browser is closed.

## Flash Player version

Adobe Flash Player version 11.2 or higher is required for running the Virtual Appliance on a web browser.

## Changing the IP address

Stop all daemons with the vApp Manager before changing the IP address of the appliance.

## SYMCLI commands executed/submitted as root

When using the vApp Manager with the seconfig account, SYMCLI commands are executed/submitted as root.

## Least privileged permission requirements

Consult the appropriate VMware documentation for guidance on the least privileged permissions required to deploy a virtual appliance.

# CHAPTER 7

## Gatekeeper Devices

This chapter describes the function of gatekeepers and how to create them.

- ◆ [Overview.....](#) 208
- ◆ [Creating gatekeeper devices .....](#) 211
- ◆ [Displaying gatekeeper information .....](#) 212

## Overview

Solutions Enabler is an EMC software component used to control the storage features of VMAX arrays. It receives user requests via CLI, GUI, or other means, and generates system commands that are transmitted to the VMAX array for action.

Gatekeeper devices are LUNs that act as the *target* of command requests to Enginuity-based functionality. These commands arrive in the form of disk I/O requests. As more commands are issued in parallel from the host, and as the commands grow in complexity, more gatekeepers will be required to handle the commands in a timely manner.

A gatekeeper is not intended to store data and is usually configured as a small device. Users are encouraged to not build gatekeepers in larger sizes as the small size can be used as a characteristic to locate gatekeepers. Gatekeeper devices should be mapped and masked to single hosts only and should not be shared across hosts.

Starting with Enginuity 5876, multipath gatekeeper support has been expanded beyond using PowerPath to include a limited set of third-party multipathing solutions on a limited set of platforms.

---

**Note:** For specific gatekeeper sizing recommendations for all configurations, refer to EMC Knowledgebase solution emc255976 available on EMC Online Support.

---

## How SYMCLI uses gatekeepers

When selecting a gatekeeper to process system commands, Solutions Enabler starts with the highest priority gatekeeper candidate (Priority 1, as described in [“Gatekeeper candidates” on page 208](#)). If there are no gatekeeper candidates at that priority, or the device is not accessible or currently in use, then Solutions Enabler tries to use the remaining gatekeeper candidates, in priority order, until it successfully obtains a gatekeeper, or it has tried all gatekeeper candidates.

When Solutions Enabler successfully obtains a gatekeeper, it locks the device, and then processes the system commands. Once Solutions Enabler has processed the system commands, it closes and unlocks the device, freeing it for other processing.

If the base daemon is performing gatekeeper management, gatekeepers are opened and locked, then used repeatedly to process system commands. The base daemon closes and unlocks gatekeepers after they have not been used for at least 60 seconds.

## Gatekeeper candidates

Solutions Enabler selects certain devices from the list of all PDEVs to be gatekeeper candidates and automatically excludes the following PDEVs from the candidate list:

- ◆ BCVs
- ◆ Meta devices
- ◆ Virtual devices (VDEVs)

---

**Note:** From HYPERMAX OS 5977, gatekeepers must always be thin devices.

---

Solutions Enabler selects a gatekeeper from the candidate list based on a pre-established priority scheme. The gatekeeper priority list includes all gatekeeper candidates prioritized from the highest to the lowest, as shown below:

1. Small ( $\leq 10$  cylinders) devices, marked by the storage array with the inquiry gatekeeper flag.
2. Standard non-RDF and non-metadevices.
3. RDF R1 devices.
4. RDF R2 devices.
5. VCM/ACLX devices.

## Using the `gkavoid` and `gkselect` files

The `gkavoid` file specifies the VMAX devices that should not be used as gatekeepers. The gatekeeper avoidance file contains physical device names with one PdevName (`/dev/rdisk/c2t0d1s2`) per line.

The `gkselect` file specifies only those VMAX devices to be used as gatekeepers. The file contains physical device names, with one PdevName (for example, `/dev/rdisk/c2t0d1s2`) per line.

When determining which of these files is appropriate for your environment, consider the following:

---

**Note:** In the following list, *data device* refers to a non-dedicated gatekeeper device.

- ◆ If too many gatekeepers are in the `gkavoid` file, Solutions Enabler may end up selecting a *data device* as a gatekeeper. This could potentially cause significant impact on host application performance.
- ◆ If there are not enough gatekeepers in the `gkselect` file, array control operations may time out. However, no extra maintenance is required when adding new *data devices*, as would be necessary when using only the `gkavoid` file.

---

**Note:** If there are no devices listed in the `gkselect` file for a particular VMAX array, or if all of the devices listed in the file are offline or do not exist at the time the file is read, then normal gatekeeper selection rules apply, as explained in [“Gatekeeper candidates” on page 208](#). This may also result in Solutions Enabler choosing a data device as a gatekeeper and that could impact host application performance. (The base daemon picks up all changes to the `gkselect` and `gkavoid` files dynamically.)

---

**Note:** If a device is listed in both the `gkavoid` file and the `gkselect` file, the device will be avoided.

---

## Sizing gatekeepers

When a VMAX array is installed, the EMC Customer Engineer selects and configures VMAX devices with less than 10 cylinders (less than 5 MB) for use as gatekeeper devices.

However, the gatekeeper device must be at least as large as the minimum volume size accessible by your host, which is usually, 6 cylinders, 2.8 MB. Consult your host documentation for the minimum device size accessible by your particular host to determine the minimum gatekeeper device size for your environment.

---

**Note:** For specific gatekeeper sizing recommendations for all array configurations, refer to EMC Knowledgebase article emc255976 available on EMC Online Support.

---

You can determine the storage size of a VMAX device using:

- ◆ The `sympd` command using the `list` and `show` arguments as follows:
  - `list` — Displays a list of physical device names and storage size (in MBs) for a specific VMAX array.
  - `show` — Displays the parameters of a specified physical device that includes the device capacity or size in blocks and megabytes.
- ◆ The `syminq` command and specifying the physical device name.

---

**Note:** Sometimes the EMC Customer Service Engineer configures a few VMAX devices for use as dedicated gatekeepers. You can distinguish these devices in the output of the `syminq` command by locating a symbol `GK` next to the `PdevName` (physical device name). Devices listed in the `gkselect` file are not required to have the `GK` attribute, though it is highly recommended. Listing non-dedicated gatekeeper devices in the file may cause significant impact on host application performance.

---

---

**Note:** For Windows platforms in a clustered environment, gatekeepers must be a minimum of 8 MB in size and have a signature. In a non-clustered environment, gatekeeper devices smaller than 8 MB will show up in the new Disk Manager as devices with no available information. (Disk Manager just displays the disk number and a blank bar.) The devices are still addressable at the SCSI level, and `SYMCLI` scripts continue to work. (There may be some implications for device naming, since the Windows Device Manager does not create some of the normal device objects for devices smaller than 8 MB).

---

---

**Note:** For specific gatekeeper sizing recommendations for all array configurations, refer to EMC Knowledgebase article emc255976 available on EMC Online Support.

---

## VMware setup

Unique gatekeepers must be assigned to each virtual machine, as a raw device, to provide Solutions Enabler capabilities to each virtual machine. Individual applications may have specific requirements for gatekeepers.

For specific gatekeeper sizing recommendations for all array configurations, refer to Knowledgebase article EMC255976 available on EMC Support.

## Creating gatekeeper devices

The `symconfigure` command automates the process of creating gatekeeper devices. These gatekeeper devices are sized as follows:

- ◆ Engenuity 5771 or higher — 3 cylinders
- ◆ Engenuity versions lower than 5771 — 6 cylinders

Both sizes of gatekeeper devices are protection type RAID1.

Use the following syntax in a command file to create gatekeeper devices:

```
create gatekeeper count=n,
      emulation=EmulationType,
      [, type=thin]
      [, binding to pool=<PoolName>]]
      [, mvs_ssid=n]
      [, [mapping to dir DirNum:PortNum
      [starting] target = scsi_target,
      lun=scsi_lun, vbus=fibres_vbus
      [starting] base_address=cuu_address]...]
      [host_id= compatible|native];
```

Where:

**count** — Indicates the number of devices to create.

**emulation** — Specifies the device emulation type.

**type=thin** — Specifies that the gatekeeper is a thin gatekeeper

**binding to pool** — Specifies the existing device pool to which the newly created thin GK should be bound

**mvs\_ssid** — Specifies the subsystem ID group value for the newly created device.

**mapping to dir** — Specifies the director/port addresses to which the newly created gatekeeper should be mapped.

**target** — Indicates a hex value for the SCSI target ID.

**lun** — Indicates a hex value for the SCSI logical unit number.

**vbus** — Specifies the virtual bus address if mapping to an FA port using volume set addressing.

**base\_address** — Indicates a base or alias address for a device being mapped to an EA or EF port.

**host\_id** — Indicates the host ID format, that is either the new Federated ID format (NATIVE) or an ID compatible with the previous ID format (COMPATIBLE) that is a non-portable ID value only unique within the array. Additionally, you can change the device's host ID on an existing device to either a native ID or a compatible ID.

**Restrictions** On Engenuity versions lower than 5874, this command only allows the creation of a gatekeeper device. It does not allow the mapping of the newly created device to be performed at the same time as the creation of the new device.

On HYPERMAX OS 5977, this command only allows the creation of thin gatekeeper devices.

Native ID is not supported for iSeries (D910\_099) devices.

The following restrictions apply for SBC and VMAXe series platforms:

- ◆ You are not allowed to create any disk group provisioned devices using the `create dev` command, except for DATA devices. It is advised to use the `create gatekeeper` command introduced in Solutions Enabler V7.3 to create gatekeeper devices.
- ◆ A gatekeeper device created with the `create dev` command will have a fixed size of 6 cylinders for DMX 800/1000/2000/3000, and 3 cylinders for DMX-3, DMX-3 950, DMX-4, DMX-4 950 or higher. There are no options to specify other device sizes.
- ◆ The gatekeeper device created using the `create dev` command has a fixed protection type of RAID 1. There are no options to specify another device protection type.

## Displaying gatekeeper information

The `stordaemon` commands in this section display information on gatekeeper usage.

### Displaying gatekeeper statistics

To display information on the number of gatekeeper candidates, dedicated gatekeepers, unique gatekeepers, open gatekeepers, and gatekeeper utilization information, use the following command:

```
stordaemon action storapid -cmd show -gk_stats [-sid SymmID]
```

Where *SymmID* specifies the VMAX array for which you want to display information. Issuing this command without the `-sid` option will display information on all storage arrays.

For example:

```
stordaemon action storapid -cmd show -gk_stats -sid 343
```

And the above command produces output similar to the following:

```
G A T E K E E P E R   S T A T I S T I C S
```

```
Symmetrix ID: 000195700343
```

	Total Paths	Unique Paths
	-----	-----
Pdevs	232	232
GK Candidates	232	232
Dedicated GKs	40	40
VCM/ACLX devs	0	0
Pdevs in gkavoid	32	
Pdevs in gkselect	0	
Max Available GKs	8	
Num Open GKs	3	
Gatekeeper Utilization		
Current	0 %	
Past Minute	10 %	
Past 5 Minutes	11 %	

```

Past 15 Minutes          11 %
Since Midnight           0 %
Since Starting           0 %

Highwater
Open Gatekeepers        4
Time of Highwater       01/19/2014 10:57:03

Gatekeeper Utilization   25 %
Time of Highwater       01/19/2014 09:48:07

Gatekeeper Timeouts
Since starting           0
Past Minute             0
Time of last timeout    N/A

```

## Displaying gatekeeper candidates and gatekeeper states

To display which devices are gatekeeper candidates and the state of each gatekeeper (opened or closed), use the following command:

```
stordaemon action storapid -cmd show -gk_pdevs [-sid SymmID] [-v]
```

Where *SymmID* specifies the storage array for which you want to display information. Issuing this command without the `-sid` option will display information on all storage arrays. The `-v` option specifies to display a verbose listing.

For example:

```
stordaemon action storapid -cmd show -gk_pdevs -sid 343
```

# CHAPTER 8

## Uninstalling Solutions Enabler

This chapter explains how to uninstall Solutions Enabler:

- ◆ Overview..... 216
- ◆ Uninstalling Solutions Enabler from UNIX..... 216
- ◆ Uninstalling Solutions Enabler from Windows ..... 219
- ◆ Uninstalling Solutions Enabler from OpenVMS ..... 221
- ◆ Rolling back an upgrade..... 222

## Overview

To uninstall Solutions Enabler from a UNIX host, you must first shutdown the application processes that use the Solutions Enabler libraries and binaries, and then uninstall the software.

---

**Note:** This is not necessary on Windows hosts since the uninstall program will prompt you to shut down the application processes. If you are uninstalling from a Windows host, skip this step and go to [“Uninstalling Solutions Enabler from Windows” on page 219](#).

---

## Stopping the application processes

To stop the application processes:

1. For UNIX, issue the following command to identify any applications using the Solutions Enabler libraries:

```
fuser /usr/symcli/shlib/libsym* /usr/symcli/shlib/libstor*
```

For AIX, issue:

```
fuser -x -f /usr/symcli/shlib/library_name
```

2. Issue the following command to stop the Solutions Enabler daemons:

```
stordaeomon shutdown all
```

---

**Note:** For more information on this command, refer to [“Stopping daemons” on page 119](#).

---

3. Issue the following command to verify that the daemon(s) have stopped:

```
stordaeomon list -running
```

---

**Note:** For more information on this command, refer to [“Viewing daemons” on page 119](#).

---

## Uninstalling the software

To uninstall the Solutions Enabler software, refer to the following:

- ◆ For UNIX, refer to [“Uninstalling Solutions Enabler from UNIX” on page 216](#).
- ◆ For Windows, refer to [“Uninstalling Solutions Enabler from Windows” on page 219](#)
- ◆ For OpenVMS, refer to [“Uninstalling Solutions Enabler from OpenVMS” on page 221](#).

## Uninstalling Solutions Enabler from UNIX

You can uninstall Solutions Enabler from a UNIX host using either the Solutions Enabler uninstall script or your native install tools (e.g., `rpm --erase` on Linux).

**CAUTION**

Take care when removing Solutions Enabler, as it may be a prerequisite for other installed products.

## Using the script

To use the script to uninstall Solutions Enabler from all supported UNIX hosts, change directory to `/usr/symcli/install` and run the following script:

```
./se8030_install.sh -uninstall
```

For help running the uninstall script, run the following script:

```
./se8030_install.sh -help
```

The uninstall script creates log files in the install root directory `/opt/emc/logs` in the format `SE_NI_KitVersion_TimeStamp.log`, where `TimeStamp` is in the form `YYMMDD_HHmmSS`.

## Persistent data

The persistent data will remain under `/usr/emc/API/symapi` or in the data directory selected during installation.

The persistent data will remain accessible from the softlink `/var/symapi`.

## Decremental method

To uninstall a single Solutions Enabler component you can use the `-decrement` option:

```
./se8030_install.sh -decrement [-cert][-jni] [-srm] [-symrec]
```

**Note:** This method is not supported on Solaris.

For example, to uninstall the Solutions Enabler SYMRECOVER component, enter:

```
./se8030_install.sh -decrement -symrec
```

## Using native tools

When using your native tools to uninstall Solutions Enabler, you *must* uninstall the Solutions Enabler packages in the following order:

**Table 42** Package order when uninstalling using UNIX native tools

Order	Solaris	For all other UNIX operating systems
1	SYMse	SMI
2	SYMdse	64BIT
3		SRM
4		JNI
5		SYMRECOVER
6		SYMCLI

**Table 42** Package order when uninstalling using UNIX native tools

Order	Solaris	For all other UNIX operating systems
7		BASE
8		THINCORE
9		DATA
10		CERT

In addition, you must also verify that all application processes using the Solutions Enabler libraries and binaries are stopped. For instructions, refer to [“Stopping the application processes” on page 216](#).

## Uninstalling from Linux

Use the following commands when uninstalling Solutions Enabler from a Linux host:

```
rpm -qa|grep symcli
```

Lists all of the installed RPMs.

```
rpm -ql <RPM entry from the installed list>
```

Lists all of the files in the specified RPM. For example, to list all of the files in the core component, enter:

```
rpm -ql symcli-thincore-8.0.3.1701-116.1
```

```
rpm -e <RPM entry from the installed list>
```

Uninstalls the specified RPM. For example, to uninstall the core component, enter:

```
rpm -e symcli-thincore-8.0.3.1701-116.1
```

## Uninstalling from AIX

Use the following commands when uninstalling Solutions Enabler from an AIX host:

```
lslpp -L | grep SYMCLI
```

Lists all installed Solutions Enabler filesets.

```
installp -u FilesetName
```

Uninstalls a fileset. For example, to uninstall the core component, enter:

```
installp -u SYMCLI.THINCORE
```

## Uninstalling from HPUX

Use the following commands when uninstalling Solutions Enabler from an HPUX host:

```
swlist -l fileset | grep SYMCLI
```

Lists all of the installed Solutions Enabler filesets.

```
swremove FilesetName
```

Uninstalls a fileset. For example, to uninstall the Solutions Enabler core component, enter:

```
swremove SYMCLI.THINCORE
```

## Uninstalling from Solaris

Use the following commands when uninstalling Solutions Enabler from a Solaris host:

```
pkginfo | grep SYM
```

Lists all of the installed Solutions Enabler packages.

```
pkgrm PackageName
```

Uninstalls a package. For example, to uninstall the Solutions Enabler SYMse component, enter:

```
pkgrm SYMse
```

## Uninstalling Solutions Enabler from Windows

This section describes the various methods available for uninstalling Solutions Enabler from a Windows host.

**Take care when removing Solutions Enabler, as it may be a prerequisite for other installed products.**

### Using the InstallShield wizard

To uninstall Solutions Enabler using the InstallShield wizard:

1. Change the directory to the location of the Solutions Enabler kit by entering the following:

```
cd \Install_disk_mount_point\Windows
```

2. Start the uninstall by running the following:

```
se8030-Windows-x64.exe
```

3. In the **InstallShield Wizard for Solutions Enabler Welcome** dialog box, click **Next**.
4. In the **Program Maintenance** dialog box, select **Remove** and click **Next**.
5. In the **Remove the Program** dialog box, click **Remove**.
6. In the **Installation Program Complete** dialog box, click **Finish** to complete the removal process.

### Using the command line

To uninstall Solutions Enabler from the command line using the msi installer options, run the following command:

```
start /wait FullPathToInstallImage\  
se8030-Windows-x64.exe /s /x /v/qn
```

Where:

FullPathToInstallImage is the path to the executable.

/s is the command to run silently.

`/x` is the command to uninstall.

`/v` is the command gateway for `msiexec.exe`.

`/qn` is the silent option.

---

**Note:** If the `/s` and `/v` options are entered as capital letters (`/S /V`), and a space is used to separate the `/v` and `/qn` options, the uninstallation starts in Wizard mode.

---

## Removing the msi image

You can use either of the following methods to uninstall the msi image:

- ◆ Enter the following command, specifying the GUID of the product to uninstall:

```
start /wait msiexec.exe /x {GUID} /qn
```

Possible values for `GUID` are:

```
{A2A6F36B-9F18-41fe-BCA1-FECF2DE9F5BC} Solutions Enabler
{CA1446F4-FF86-46ff-9783-C9E1AF21FE5E} STORBLK
{DFFEB2C8-5442-45e2-B2E1-9D90AF84BCF5} SDK
{E4D9E227-D0F3-4666-8BEF-34C577CE562B} TCLIENT
```

- ◆ Use the Windows Installer Clean Up utility, `msicuu2.exe`:
  - a. Download the `msicuu2.exe` from Microsoft and install it on the host.
  - b. From the Windows **Start** menu, select **All Programs**.
  - c. Select the application to remove and click **Remove**.
  - d. Stop the following services in the order listed below. You can do this from either the cmd prompt or the **Services** dialog.
    - Storsrvd
    - Storgnsd
    - Storrdfd
    - Storevntd
    - Storsrmd
    - Storstpd
    - Stororad
    - Storsqld
    - Storudbd
    - Storapid
    - ECOM
    - slpd
  - e. Remove the list of files from System32. The list of files is the same as those in `InstallDir\Symcli\shlib`.
  - f. Remove the `Symcli` directory and all its subdirectories.
  - g. Remove the `ECOM` directory and all its subdirectories.

- h. Remove the subdirectories from `Symapi`, except for the `Config` and `db` directories.
- i. Remove the following registry entries:
  - HKEY\_LOCAL\_MACHINE\SOFTWARE\EMC\EMC Solutions Enabler
  - HKEY\_LOCAL\_MACHINE\SOFTWARE\EMC\SYMCLI
  - HKEY\_LOCAL\_MACHINE\SOFTWARE\EMC\WideSky
- j. From under the following registry key, remove the entries that only point to the SYMAPI or SYMCLI:
  - HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\SharedDlls

## Using the Windows Add/Remove Programs dialog

To uninstall Solutions Enabler from the Windows **Add or Remove Programs** dialog:

1. From the Windows **Start** menu, select **Settings | Control Panel | Add or Remove Programs**.
2. In the **Add or Remove Programs** dialog, select **EMC Solutions Enabler** and click **Uninstall**.

## Using the Windows Programs and Features dialog

To uninstall Solutions Enabler from the Windows **Programs and Features** dialog:

1. From the Windows **Start** menu, select **Control Panel**.
2. Click **Programs and Features**.
3. Under **Programs**, click **Uninstall a Program**.
4. Select **EMC Solutions Enabler** and click **Uninstall**.

## Uninstalling Solutions Enabler from OpenVMS

To uninstall Solutions Enabler from an OpenVMS host:

**Take care when removing Solutions Enabler, as it may be a prerequisite for other installed products.**

1. Verify that all application processes that use the Solutions Enabler libraries and binaries are stopped.
2. If file `emc$root:[-]emc_disable_autostart.com` exists then execute the following:
 

```
@emc$root:[-]emc_disable_autostart.com
```
3. Delete all the files in the `sys$specific:[emc]` and `sys$specific:[000000]emc.dir` directories. If the environment is a cluster, delete these files from every node in the cluster where Solutions Enabler was running.
4. Delete all the files from the installation directory.

## Rolling back an upgrade

To roll back your upgrade, you must have created copies of the host database and config directories, as explained in [“Before you begin” on page 22](#):

1. Verify that all application processes that use the Solutions Enabler libraries and binaries are stopped.

---

**Note:** For instructions, refer to [“Stopping the application processes” on page 216](#).

---

2. Export all device groups from the current SYMAPI database:
  - a. Issue a `symdmg list` command to list all the device groups.
  - b. Issue a `symdmg export` command to export the device groups.
  - c. Issue a `symcvg list` command to list all the composite groups.
  - d. Issue a `symcvg export` command to export the composite groups.

---

**Note:** This export is necessary because older versions of Solutions Enabler may not be able to read a database once a newer version of Solutions Enabler has converted it.

---

---

**Note:** For more information on these commands, refer to the *EMC Solutions Enabler Array Management CLI User Guide*.

---

3. Uninstall your software according to the platform-specific procedures earlier in this chapter.
4. Install the desired version of Solutions Enabler.
5. Once the installation is complete, issue a `symcfg list` command to verify that the SYMAPI database can be used by the older version:
  - If the database can be used, the rollback is done.
  - If the database cannot be used, issue a `symcfg discover` command to create an array host database file, `symapi_db.bin`, and import all the exported device groups.

# CHAPTER 9

## Installing the Solutions Enabler Virtual Appliance

This chapter explains how to install the Solutions Enabler Virtual Appliance in a VMware infrastructure environment:

- ◆ Introduction ..... 224
- ◆ Before you begin ..... 224
- ◆ Installing the virtual appliance directly to the ESX Server ..... 225
- ◆ Installing the virtual appliance through a vCenter Server ..... 228
- ◆ Launching vApp Manager ..... 231
- ◆ Updating the Solutions Enabler Virtual Appliance ..... 232
- ◆ Deleting the Solutions Enabler Virtual Appliance ..... 234
- ◆ Deleting the Solutions Enabler Virtual Appliance ..... 234

## Introduction

The Solutions Enabler Virtual Appliance is a VMware ESX server virtual machine that provides all the components you need to manage your storage environment using the `storsrvd` daemon and Solutions Enabler network client access. These include:

- ◆ EMC Solutions Enabler V8.0.3 (solely intended as a SYMAPI server for Solutions Enabler client access)
- ◆ Linux OS (SUSE 11 SP3 JeOS)
- ◆ SMI-S Provider V8.0.3

In addition, the Solutions Enabler Virtual Appliance includes a browser-based console called EMC vApp Manager for Solutions Enabler to configure your storage environment. vApp Manager enables you to perform the following configuration tasks:

- ◆ Monitor the application status
- ◆ Start and stop selected daemons
- ◆ Download persistent data
- ◆ Configure the `nethost` file (required for client access)
- ◆ Discover storage arrays
- ◆ Modify options and daemon options
- ◆ Add array-based and host-based license keys
- ◆ Run a limited set of Solutions Enabler CLI commands
- ◆ Configure ESX host and gatekeeper devices
- ◆ Launch Unisphere for VMAX (available only in Unisphere versions of the appliance console)
- ◆ Configure iSCSI initiator and map iSCSI gatekeeper devices
- ◆ Configure additional NIC card (optional)
- ◆ Download SYMAPI debug logs
- ◆ Import CA signed certificate for web browser
- ◆ Import Custom certificate for `storsrvd` daemon
- ◆ Check disk usage
- ◆ Restart appliance
- ◆ Configure symavoid entries
- ◆ Load array-based eLicenses
- ◆ Enable SSH
- ◆ Configure LDAP
- ◆ Manager users
- ◆ Reset hostname
- ◆ Update `etc/hosts`

---

**Note:** For information on using vApp Manager, refer to its online help.

---

---

**Note:** Root login is not supported on the SUSE 11 virtual machine.

---

## Before you begin

Before you begin to install the Solutions Enabler Virtual Appliance, be sure to complete the tasks listed in this section:

- ❑ Verify that you are installing the latest version of the appliance by checking EMC Online Support for updates.
- ❑ Verify that the client is running:
  - VMware vSphere Client
  - Either of the following browsers with cookies and Javascript enabled:
    - Internet Explorer 9.0 through 11.0 (Desktop only)
    - Firefox 30 or later
    - Chrome 21.0.1180 or later

Browsers should have Flash Player 11.2 plug-in installed. If your browser has an outdated version of Flash Player, you will be prompted to download the latest version when you start the web console.
- ❑ Verify that the VMware ESX Server meets the following minimum requirements:
  - Version 4.0 or higher
  - Dual disk. 16 GB of disk space and another 5 GB (expandable) disk space
  - 2GB memory
  - 1 CPU

## Installing the virtual appliance directly to the ESX Server

This section describes how to install the Solutions Enabler Virtual Appliance directly to the ESX Server.

### Step 1: Import the virtual appliance

To import the virtual appliance:

1. Download the OVF archive file (\*.ova) containing the installation program from EMC Online Support to a temporary directory.
2. Start the vSphere Client and log in to the ESX Server on which you will be installing the appliance.
3. Click **Ignore** in the security warning message.
4. From the **File** menu, select **Deploy OVF Template**.
5. Browse to the OVF archive file, located in the temporary directory you created earlier. Select the OVF archive file with the suffix \*vapp\_OVF10.ova.
6. Click **Next**.
7. On the **Details** page, verify the details about the appliance and click **Next**.
8. On the **End User License Agreement** page, select **Accept all license agreements** and click **Next**.
9. On the **Name and Location** page, specify a name for the appliance and click **Next**.
10. If a resource pool is available, the **Resource Pool** page displays. Select the resource pool of your choice and click **Next**. Otherwise, the **Resource Pool** page is skipped.

11. On the **Datastore** page, select the datastore of your choice and click **Next**.
12. On the **Disk Format** page, select the format in which to store the virtual machine's virtual disks and click **Next**.
13. On the **Network Mapping** page, map the source network to the appropriate destination network.
14. On the **Ready to Complete** page, verify the information and click **Finish**.
15. In the Completed Successfully message, click **Close**.
16. Continue with "[Step 2: Select gatekeepers](#)" next.

## Step 2: Select gatekeepers

Present uniquely defined gatekeepers by way of raw device mappings (RDM). For instructions, refer to the appropriate VMware documentation.

Solutions Enabler manages storage arrays through gatekeeper devices mapped to the virtual appliance as RDM pass-through devices. The management is done through EMC proprietary commands using SCSI 3B/3C write/read commands. For every call, a WRITE command is issued to send the request, and then a READ command to get the results.

---

**Note:** Gatekeepers can be added using vApp Manager. For detailed information, refer to [vApp Manager online help](#).

Continue with "[Step 3: Power on and configure the Virtual Appliance](#)" below.

## Step 3: Power on and configure the Virtual Appliance

To power on and configure the Virtual Appliance:

1. On the **Summary** page of the Virtual Infrastructure Client, click **Power On**.
2. Click the **Console** tab and watch as the appliance starts up.
3. At the following prompts, enter static IP configuration information:

```
Please enter static IP configuration:
```

```
- IP Address [ ]:
```

Type the address assigned to the appliance, and then type **y** to continue with the configuration.

---

**Note:** The virtual appliance uses this IP address to query the DNS Server and get its hostname. Therefore, you must ensure that the IP address has a hostname mapping in the DNS Server.

```
- Netmask [ ]:
```

Type the mask of the network on which the appliance will be running, and then type **y** to continue with the configuration.

```
- Gateway [ ]:
```

Type the gateway address to the network on which the appliance will be running, and then type **y** to continue with the configuration.

– DNS1 []:

Type the first DNS server address, and then type **y** to continue with the configuration.

– DNS2 []:

Type the second DNS server address, and then type **y** to continue with the configuration.

– Is a proxy server necessary to reach the Internet? y/n [n]:

A **y** response enables you to specify the IP address of the proxy server and the port.

The network is configured at this point.

4. At the following prompt, specify whether you want to set the time zone:

Do you want to set the time zone? y/[n] :

- A **n** response continues the configuration. If you select this option, you can use the appliance console to specify the time zone at a later time.
- A **y** response produces the following series of prompts that will enable you to set the time zone:
  - Please select a continent or ocean  
Type the number that corresponds to the time zone location and press **Enter**.
  - Please select a country  
Type the number that corresponds to the country-specific time zone you want to set and press **Enter**.
  - Please select one of the following time zone regions  
Type the number that corresponds to regional time zone you want to set and press **Enter**.

The time zone is now set.

5. At the following prompt, specify whether you want to enter the host ESX Server information:

Do you want to set the host ESX Server y/[n]? :

- A **n** response continues the configuration. If you select this option, you can use the Configuration Manager to enter the host ESX Server details at a later time. For instructions, refer to the Configuration Manager's online help.
- A **y** response prompts you for the ESX Server hostname. In which case you should type the fully qualified hostname of the ESX Server and press **Enter**.  
  
When prompted to enter the root password, type the root password of the ESX Server and confirm it by typing it again.

A Welcome screen displays. You have now finished installing the Solutions Enabler Virtual Appliance.

6. Continue with [“Launching vApp Manager” on page 231](#).

## Installing the virtual appliance through a vCenter Server

This section describes how to install the Solutions Enabler Virtual Appliance through a vCenter Server 4.0 and higher.

### Step 1: Import and configure the virtual appliance

To import and configure the virtual appliance:

1. Download the OVF archive file (\*.ova) containing the installation program from EMC Online Support to a temporary directory.
2. Start the vSphere Client and log in to the vCenter Infrastructure Server through which you will be installing the virtual appliance.
3. Click **Ignore** in the security warning message.
4. From the navigation tree, select the ESX Server on which you will be installing the virtual appliance.
5. From the **File** menu, select **Deploy OVF Template**.
6. Browse to the OVF archive file, located in the temporary directory you created earlier. Select the OVF archive file with the suffix `*vapp_OVF10.ova`.
7. Click **Next**.
8. On the **Details** page, verify the details about the appliance and click **Next**.
9. On the **End User License Agreement** page, select **Accept all license agreements** and click **Next**.
10. On the **Name and Location** page, specify a name for the appliance and click **Next**. It is recommended that you name the appliance with the same fully qualified hostname of the virtual appliance.
11. Select the host/cluster to run the virtual appliance.
12. If a resource pool is available, the **Resource Pool** page displays. Select the resource pool of your choice and click **Next**. Otherwise, the **Resource Pool** page is skipped.
13. On the **Datastore** page, select the datastore of your choice and click **Next**.
14. On the **Network Mapping** page, map the source network to the appropriate destination network.
15. Customize the software solution for this installation by doing the following:
  - a. Provide valid values for the following OVF properties:
    - IP Address
    - Netmask
    - Gateway
    - DNS Server 1
    - DNS Server 2

---

**Note:** The virtual appliance uses this IP address to query the DNS Server and get its hostname. Therefore, you must ensure that the IP address has a hostname mapping in the DNS Server.

---

- b. Optionally, provide/select valid values for the following OVF properties:
  - Proxy Server: Enter the IP address of the proxy server and port. For example:  
*ProxyServer-IP:Port*
  - ESX Server Name: Enter the fully qualified ESX Server hostname.
  - ESX Server Password: Enter the ESX Server password in base64 encryption format.
16. On the **Ready to Complete** page, verify the information and click **Finish**.
17. In the Completed Successfully message, click **Close**.
18. Continue with [“Step 2: Select gatekeepers”](#) next.

## Step 2: Select gatekeepers

1. Select gatekeepers as described in [“Step 2: Select gatekeepers” on page 226](#).  
You can configure the virtual appliance to add two gatekeeper devices per storage array when it firsts boots up. For instructions, refer to [step 10 on page 228](#).
2. Continue with [“Step 3: Power on the virtual appliance”](#) next.

## Step 3: Power on the virtual appliance

To power on and configure the Virtual Appliance:

1. On the **Summary** page of the Virtual Infrastructure Client, click **Power On**.
2. Click the **Console** tab and watch as the appliance starts up.  
A Welcome screen appears. You have now finished installing the Solutions Enabler Virtual Appliance.
3. Continue with [“Launching vApp Manager”](#).

## Installing the virtual appliance using OVFTOOL

Solutions Enabler Virtual Appliance can be installed through command line from any Linux host. This section how to install the virtual appliance using OVFTOOL.

To install Solutions Enabler Virtual Appliance using OVFTOOL, the following are required:

- ◆ vCenter Server 4.0 and above.
- ◆ ESX Server 4.0 and above managed by vCenter Server 4.x.
- ◆ ovftool 1.0 and above

---

**Note:** Please refer to the appropriate documentation for installing vCenter Server and VMware ovftool.

---

Here is a brief description of the steps on how to install the virtual appliance using OVFTOOL:

1. Install and Setup the vCenter Server.
2. Add the ESX Server to the vCenter Server datacenter.
3. Install VMware OVFTOOL on a Linux host.
4. Move the Solutions Enabler Virtual Appliance kit to the above host.
5. Run the ovftool command with necessary command line switches. For more information on using the command, refer to [“Using OVFTOOL.”](#)
6. The Solutions Enabler Virtual Appliance is installed and powered on automatically.
7. Continue with [“Launching vApp Manager”](#).

## Using OVFTOOL

OVFTOOL has the following syntax:

```
/usr/bin/ovftool --acceptAllEulas --overwrite --powerOffTarget
--powerOn --prop:ipAddress=<IP-ADDRESS> --prop:netmask=<NETMASK>
--prop:gateway=<GATEWAY> --prop:dns1=<DNS1> --prop:dns2=<DNS2>
--prop:timezone=<TIMEZONE> --prop:esxServer=<ESX-SERVER>
--prop:encr yRootPasswd=<ROOT-PASSWORD> --name=<VM-DISPLAYNAME>
--datastore=<DATASTORE> --net:Network\ 1=<VM Network Port Group>
--net:Network\ 2=<VM Network Port Group> <OVA-FILE>
vi://Administrator:<vCenter-admin-passwd>@<vCenter-Server>/<DataCenter-Name>/host/<esx-server-name>
```

Where:

<IP-ADDRESS>	IP Address of the Virtual Appliance.
<NETMASK>	Netmask of the Virtual Appliance.
<GATEWAY>	Gateway
<DNS1>	IP of DNS Server1.
<DNS2>	IP of DNS Server2.
<TIMEZONE>	Time Zone setting. (Optional)
<ESX-SERVER>	Fully qualified hostname of ESX server. (Optional)
<ROOT-PASSWORD>	Root password of ESX Server in base64 encrypted format. (Optional)
<VM-DISPLAYNAME>	VM Displayname. To automatically add gatekeeper devices during virtual appliance boot, VM Displayname to be same as fully qualified hostname of Virtual Appliance.
<DATASTORE>	Name of the datastore attached to ESX Server. Required only if more than one datastore is attached to ESX Server.
<VM Network Port Group>	VM network port group. If both NIC cards need to be in different network, then the VM Network port group need to be different.
<OVA-FILE>	Absolute path of ova file.

⟨vCenter-Server⟩	Name of the vCenter.
⟨vCenter-admin-passwd⟩	vCenter Server's Administrator password.
⟨esx-server-name⟩	ESX Server name as displayed in the vCenter Server.

## Launching vApp Manager

To launch vApp Manager:

1. Type one of the following URLs in a browser:

`https://appliance_IP:5480`

or

`https://appliance_host_name:5480`

2. On the log in panel, type **seconfi**g for both the User and Password, and then click **Login**.

---

**Note:** You are required to change your password from vApp Manager on first login. vApp Manager can also be configured to use LDAP for user authentication. For more information on that, refer to vApp Manager online help.

---

3. vApp Manager displays. For information on using vApp Manager, refer to its online help.

## Registering VASA Provider with vSphere

VMware VASA (VMware APIs for Storage Awareness) Provider improves VMware vSphere's ability to monitor and automate storage related operations. VASA Provider reports information about storage topology, capabilities, and status, as well as storage events and alerts to VMware. It is a standard vSphere management plug-in that is installed on each vCenter server, and it interacts with VMware APIs for Storage Awareness.

To register the VASA Provider with vSphere:

1. Connect to the VMware vCenter Server 5.0 or above using vSphere Client.
2. In the Virtual Data Center, navigate to **Home > Administration > Storage Providers**, and select **Storage Providers** in the navigator bar.
3. In the Vendor Providers pane, select **Add**.
4. Add the vendor provider properties (name, url, and login information).

For ECOM login credentials refer to SMI-S provider documentation.

For the url use `https://<vapp-ip>:5989/vasa/services/vasaService`.

When the VASA Provider is connected, the VI Client displays the SSL certificate.

5. Click **Yes** to complete the registration.
6. Verify registration with vSphere:
  1. Navigate to **Home > Administration > Storage Providers > Vendor Providers**.

2. Verify that the VASA Provider is listed and displays the list of managed storage arrays.

## Updating the Solutions Enabler Virtual Appliance

Periodically, EMC will release security patches and hot-fixes for the Solutions Enabler Virtual Appliance. These patches and fixes are available on EMC Online Support in ISO images.

### Updating from an ISO image

This procedure explains how to upgrade the virtual appliance to V8.0.3.

To update an existing Virtual Appliance from an ISO image:

1. Upload the ISO image into the ESX Server using the VI client:
  - a. Login to the ESX Server using the VI client.
  - b. Select the ESX Server on the left panel.
  - c. Select the **Configuration** tab on the right panel.
  - d. Select **Hardware, Storage** to list the datastores connected to the ESX Server.
  - e. Right-click the datastore and select **Browse Datastore**.  
The **Datastore Browser** window displays.
  - f. Upload the appliance update ISO file.
  - g. Exit the dialog.
2. Mount the ISO image on the virtual appliance CD drive:
  - a. Right-click the virtual appliance and select **Edit Settings**.
  - b. On the **Hardware** tab, select **CD/DVD Drive 1**.
  - c. In the right panel, select **Datastore ISO File**, and click **Browse** to locate the ISO image in the datastore.
  - d. Select **Device Status, Connected**.
  - e. Click **OK** to exit the dialog box.
3. Update the appliance:
  - a. On the **Console** tab, go to the virtual appliance console.
  - b. Use the Move Up/Down keys and select **Appliance Update**.
  - c. Press **Enter** to perform the update.

The update will take approximately 10 minutes, after which the screen will return to the main console.

---

**Note:** Use the welcome screens of the vApp and the vApp Manager to confirm your virtual appliance has been updated correctly.

---

## Reconfiguring virtual appliance IP Address

This procedure explains how to re-configure an Virtual Appliance's IP Address.

1. Login to vSphere Client and go to the virtual appliance console.
2. Use the Arrow Keys to select **Configure IP** and press **Enter**. The following prompt displays:

```
DPress y to configure static IP address [y]/n:
```

3. Type **y** and press **Enter** to start configuring an static IP address for the virtual appliance. The following prompt displays:

```
IP Address [10.0.0.10]:
```

4. Type a valid IP address and press **Enter**. Alternatively you can just press **Enter** to accept the current IP address.

---

**Note:** The virtual appliance uses this IP address to query the DNS Server and get its hostname. Therefore, you must ensure that the IP address has a hostname mapping in the DNS Server.

---

The following prompt displays:

```
Netmask [255.255.252.0]:
```

5. Type a valid netmask and press **Enter**. Alternatively you can just press **Enter** to accept the current netmask. The following prompt displays:

```
Gateway [10.0.0.1]:
```

6. Type the gateway address of the network on which the appliance will be running and press **Enter**. Alternatively you can press **Enter** to accept the current gateway. The following prompt displays:

```
DNS1 [10.0.0.2]:
```

7. Type the first DNS server address and press **Enter**. Alternatively you can press **Enter** to accept the current DNS server one. The following prompt displays:

```
DNS2 [10.0.0.3]:
```

8. Type the second DNS server address and press **Enter**. Alternatively you can press **Enter** to accept the current DNS server two. The following prompt displays:

```
Is a proxy server necessary to reach the internet? y/n [n]:
```

9. Type **y** to and press **Enter** configure the proxy server. Otherwise, press **Enter** and skip to [Step 12](#).

10. At the following prompt, enter the IP address of the proxy server and press **Enter**.

```
Proxy Server[]
```

11. At the following prompt, enter the port of the proxy server and press **Enter**.

```
Proxy Port[]
```

12. The following prompt displays. Type y and press Enter to finish configuring the virtual appliance's IP address. Type n and press Enter to go back and restart the process from [Step 3](#).

```
Are the above mentioned network parameters correct? [y]/n :
```

## Deleting the Solutions Enabler Virtual Appliance

To delete the Solutions Enabler Virtual Appliance:

1. In the vApp Manager interface, backup the persistent data.
2. In the VMware management interface, power down the appliance.
3. Right-click on the appliance and select **Delete from Disk**.
4. Click **Yes** in the confirmation message.

# APPENDIX A

## SYMAPI Server Daemon Messages

This appendix describes the log messages issued by the SYMAPI server daemon (storsrvd):

- ◆ [Message format .....](#) 236
- ◆ [Messages .....](#) 237

## Message format

This section describes messages that are written to the SYMAPI server log (see [“Controlling and using the storsrvd log files” on page 168](#)) and to the system console in z/OS. All messages begin with a message identifier, followed by message text.

The message is in this format:

```
yyyy/mm/dd hh:mm:ss pid thread_name log_category msgid text
```

where:

---

<code>yyyy/mm/dd</code>	Is the date the message was issued.
<code>hh:mm:ss.xxx</code>	Is the time the message was issued in hours, minutes, seconds, and milliseconds.
<code>pid</code>	Is the process ID of the issuing process.
<code>thread_name</code>	Is the thread name of the issuing thread.
<code>log_category</code>	Is the category specified in the <code>storsrvd:log_filter</code> statement in the <code>daemon_options</code> file, which caused this message to be generated. The valid categories are: SERVER, SESSION, CONTRO, and APIREQ.
<code>msgid</code>	Is made up of the following: ANR — Indicates the server issued the message. nnnn — A numeric identifier for the message. X — A one byte severity indicator. Valid values are: I indicates an Informational message W indicates a Warning message E indicates an Error message S indicates a severe condition requiring a message
<code>text</code>	Is the message text.

---

In this section, each message shows the text of the message with indicators where substitutions are made into the text at runtime. Following the text are four paragraphs giving more information:

- ◆ *Set Step Return Code*— In a z/OS environment, some messages will cause the SYMAPI server job step return code to be set to a non-zero value. The following table shows the correlation of message severity to job step return code. Some messages are issued by multiple locations in the code. Not all uses of the message will cause the step return code to be set.

Message identifier	Return codes
I	0
W	4
E	8
S	12

If multiple messages are issued that cause the step return code to be set, the highest value will be remembered by the server, and returned to the system at job termination.

- ◆ The *Destination* of the message — `Log` and/or `Console` is shown. Most messages are written to the server log file. Some messages are written to both the log and console, but not in all cases where the message is generated. Some messages are written to the system console only, particularly those related to operator command processing. The `Console` destination applies only to `z/OS`.
- ◆ The *Description* paragraph explains the circumstances that cause the message to be issued, and explains each substituted value. This section also describes any action that the Solutions Enabler software will take.
- ◆ The *Operator Action* paragraph suggests operator intervention actions where needed.

## Messages

ANR0000I

*text*

**Destination:** Log and console.

**Description:** This message is a general purpose message to be used for any arbitrary *text*.

**Operator Action:** None.

ANR0001I

SYMAPI Server for `z/OS` ready to accept *security\_level* connections

**Destination:** Log and console.

**Description:** This message is issued when initialization is complete and the server is prepared to field connection requests from remote clients. *security\_level* indicates the types of sessions the server will accept. Possible values are:

- ◆ `ONLY NONSECURE` — Indicates that client must expect to negotiate non-SSL sessions with the server.
- ◆ `ONLY SECURE` — Indicates that the server will require clients to negotiate a secure session.
- ◆ `Both SECURE and NONSECURE` — Indicates that the server will accept sessions from clients that cannot negotiate secure and will negotiate secure sessions with clients who can.

**Operator Action:** None.

ANR0002I

*shutdown\_type* Shutdown requested

**Destination:** Log and console.

**Description:** This message indicates that a shutdown request was made. See message ANR0003I for the description of *shutdown\_type*.

**Operator Action:** None.

## ANR0003I

*shutdown\_type* Shutdown *progress*. Number of sessions remaining = *number*

**Destination:** Log and console.

**Description:** This message is issued at the start of the shutdown process. *shutdown\_type* indicates NORMAL, IMMEDIATE, or STOPPED-NORMAL.

In open systems environments, shutdown is requested by the `stord daemon` command.

In Microsoft Windows, you can use the Service Control Manager; in this case the shutdown process will always be IMMEDIATE.

In a z/OS environment, the system operator will request a NORMAL shutdown using the z/OS `STOP` command or the `SHUTDOWN` command.

The number of currently active sessions is shown in *number*. If this value is not 0, the following rules apply:

- ◆ If the *shutdown\_type* is NORMAL, the server will wait for the active sessions to end. In this case, *progress* indicates *starting* or *in progress*. Each time a session ends, the *in progress* status will be reported.
- ◆ If the *shutdown\_type* is IMMEDIATE, the server terminates without waiting for active sessions to end. See the description of the SHUTDOWN command for more details on when to use IMMEDIATE shutdown.

**Operator Action:** None.

## ANR0004I

SYMAPI Server running as a started task

**Destination:** Log.

**Description:** In a z/OS environment, the server detects when it is running as a started task (running in *STC mode*). This message serves as a visual confirmation that STC mode is active.

**Operator Action:** None, unless this is not what is intended.

## ANR0005E

Normal shutdown failed, attempting immediate shutdown

Set Step Return Code

**Destination:** Log and console.

**Description:** The server attempted to perform a normal shutdown, waiting for active sessions to complete. The normal shutdown process failed, and no recovery was possible. An immediate shutdown was attempted, because there is no other possible recovery action to take.

**Operator Action:** Be aware that the list of connections noted in message “ANR0013I” are terminated before they are able to disconnect.

## ANR0006E

Wait returned without connection or console command ready, console ECB contents *value*

**Destination:** Log.

**Description:** The server waits for incoming connection requests and instructions from the operator concurrently. If the wait is somehow satisfied but neither of these events occurred, it is considered an error. The server will continue to wait for new events.

**Operator Action:** This is an abnormal situation and may indicate some error in TCP communications or management of the operator console. If this happens repeatedly, shut the server down and try restarting the server. If the problem persists, examine your system for evidence of other problems in the TCP or console management components of your system.

ANR0008I

Server socket *socket\_event* occurred

**Destination:** Log.

**Description:** This message is issued to confirm that connection request has arrived, or that some error condition has been reflected to the TCP socket on which the server is listening. The value of *socket\_event* will be *connection request* or *exception condition*.

**Operator Action:** If the *socket\_event* is *connection request* no action is necessary since this is a documentation message, and may aid in problem diagnosis. See the description of message “ANR0009E”, if the *socket\_event* is *exception condition*.

ANR0009E

Exceeded maximum exceptions on server socket, indicating PORT\_EXCEPTION

Set Step Return Code

**Destination:** Log and console.

**Description:** This is issued after an exception condition has been raised (which may cause the issuing of “ANR0008I”). Currently, the maximum exception count is 1, meaning that there is no retry strategy when an exception occurs on the socket on which the server is listening. The server will stop listening and start a NORMAL shutdown when it notices this condition.

**Operator Action:** If *exception condition* in message “ANR0008I” is indicated, there will be other evidence in your system log showing TCP/IP problems. Refer to documentation from your TCP software provider to resolve the problems you find. When the problems are resolved, you can restart the server.

ANR0010I

SYMAPI Server Shutdown complete

**Destination:** Log and console.

**Description:** The server has completed its shutdown process and will return to the operating system.

**Operator Action:** None. This should serve as a visual confirmation that the server is finished.

## ANR0011W

SYMAPI Server not executing from an APF-authorized library, cannot continue

Set Step Return Code

**Destination:** Log and console.

**Description:** In a z/OS environment, the SYMAPI server program `storsrvd` must execute from a library authorized by the z/OS Authorized Program Facility, if the base daemon is not in use. The server checks to make sure that this condition is met. This message is issued as a warning, but an error condition may not be reflected until a SYMAPI session requests storage discovery services.

**Operator Action:** The Solutions Enabler load library can be authorized through APF in several ways. You can use the SETPROG APF command to authorize the library temporarily. In order to make the library authorized at subsequent IPLs, you must edit the PROGxx member of SYS1.PARMLIB. Refer to the IBM documentation for your level of z/OS for exact syntax and editing instructions.

## ANR0012I

Accepted *seclvl*/session *session\_number* from *IP\_address* on thread *thread\_number*

**Destination:** Log.

**Description:** The server successfully handled a connection request for a session, and started a thread to process API requests for the session. The session number is shown in *session\_number* and it is being processed on a thread with the number *thread\_number*. The session is running from a client program executing on the host at address *IP\_address*. *seclvl* indicates the negotiated security level of the session. If *seclvl* is SECURE, transmission is protected using SSL; if *seclvl* is NONSECURE, SSL protection is not in use.

**Operator Action:** None necessary. This message is documenting the start of a session. You should also see “ANR0017I” at the end of the session.

## ANR0013I

Shutdown will wait for client session *session\_number* from *IP\_address* to terminate itself

**Destination:** Log and console.

**Description:** During a normal shutdown, the server will wait for all active sessions to terminate on their own. For each session still active, the server issues this message and will wait for the session(s) to end. The substitution variables are the same as those in message “ANR0012I”.

**Operator Action:** None usually. If sessions are taking an excessive amount of time to complete, you can reissue the shutdown command with the IMMEDIATE operand to terminate the session immediately.

## ANR0014W

Terminating client session *session\_number* to *IP\_address* on Tid *thread\_identifier*},

**Destination:** Log and console.

**Description:** During an immediate shutdown, the server will report on all active sessions at the time the shutdown process begins. For each session still active, the server issues this message as a note to the operator to indicate which sessions will be terminated end. The substitution variables are the same as those in message “ANR0012I”.

**Operator Action:** None.

## ANR0015E

Session broken by dispatcher return value *return\_value*, ‘*message*’.

**Destination:** Log.

**Description:** This message is issued when a session is prematurely ended due to an unrecoverable error detected by the server API dispatching layer. When such an error is raised, the SYMAPI client will experience an ‘connection aborted’ error. The *return\_value* and *message* are intended for EMC Customer Service to diagnose the cause of the error.

**Operator Action:** Collect diagnostic data as directed by EMC Customer Service.

## ANR0016I

SYMAPI listener thread is running on thread *thread\_number*

**Destination:** Log.

**Description:** This message is issued during startup simply to report the thread number (*thread\_number*) of the SYMAPI listener thread (the server thread which listens for new connection requests).

**Operator Action:** None.

## ANR0017I

Ending session *session\_number*, total requests executed *total\_requests*

**Destination:** Log.

**Description:** See also message “ANR0012I”. This message documents the end of a session. The total number of API requests executed on the session is shown by *total\_requests*.

**Operator Action:** None.

## ANR0018E

Rejecting session *session\_number* for *user\_name@node*: *reason*

**Destination:** Log.

**Description:** A remote client attempted to connect to the running server, but is refused the session for one of the following reasons:

- ◆ **The trusted host file disallowed a client server connection** — the nethost file is allocated to the server, and the combination of the node (either host address or IP address) and the optional user identification (*user\_name*) are not specified in the nethost file. The remote client `SymInit` call returns `SYMAPI_C_HOST_FILE_REJECTION`.

- ◆ **The trusted host file could not be read or The trusted host file has a syntax error** — the nethost file exists, but could not be read or has a syntax error. The client application will receive either `SYMAPI_C_HOST_FILE_READ_ERROR` or `SYMAPI_C_HOST_FILE_SYNTAX`.
- ◆ **The maximum number of network connections has been reached on the server** — the global limit expressed by the `max_sessions` option in the `daemon_options` file is exceeded. The application will receive `SYMAPI_C_MAX_SRVR_CONNECTS_EXCEEDED ()`.

**Operator Action:** In the case of disallowed connections, the remote client user must ask the server administrator for authorization to use the SYMAPI server. The administrator must add the host (and the optional *user\_name*) information to the nethost file to authorize the client application. In the case of host file read or syntax error, make sure that the trusted host file is readable or correct the syntax error in the file. Refer to the *EMC VMAX Family Security Configuration Guide* for the syntax of the nethost file. In the case of max connection error, the server administrator may wish to set `max_sessions` to a higher value, or the client application may have to be scheduled when the server is less busy.

## ANR0019E

SYMAPI client directed debugging is disabled

**Destination:** Log and console.

**Description:** The SYMAPI server initialization process attempts to prepare for client supplied debugging settings when client sessions specify them. Invocation of an internal service failed which prevents the future use of debugging settings from client applications.

This message is preceded by “ANR0200E” which documents the reason for the failure to setup for client debugging.

**Operation Action:** The output of the preceding message “ANR0200E” gives an indication of the type of failure that is the cause of this situation. Collect and provide documentation as directed by EMC Customer Support.

## ANR0020I

SYMAPI server listening on port *port\_number* over *protocols*

**Destination:** Log and console.

**Description:** This message is issued in conjunction with message “ANR0001I” to inform the system operator about the port (*port\_number*) and internet protocols over which the server is communicating. Possible values for *protocols* are:

- ◆ IPv4 ONLY — Indicates that the server is listening for connections only using IPv4. Clients that expect an IPv6 connection will fail connecting to the server.
- ◆ IPv6 and IPv4 — Indicates that the server is listening explicitly for connections using IPv6 and IPv4.
- ◆ IPv6 with IPv4 mapping — Indicates that the IPv6 protocol supports connections from clients who are running either IPv4 or IPv6.

**Operator Action:** None.

ANR0021I

The current working directory is *directory*

**Destination:** Log.

**Description:** This message is issued early in server initialization after the server process attempts to make the SYMAPI database directory the current working directory.

**Operator Action:** None. This is an informational message.

ANR0022I

SYMAPI server is running on a VMAX Service Processor, forcing port *port*

**Destination:** Log.

**Description:** This message is written when the server detects it is running on a VMAX service processor. In this case, the server forces the use of the default port.

**Operator Action:** None. This is an informational message.

ANR0023I

SYMAPI server Symmwin Pipe Server is initialized

**Destination:** Log.

**Description:** This message is written when the special server thread to field requests from the SymmWin component has been started successfully. This will only happen if the server is running on a VMAX service processor.

**Operator Action:** None. This is an informational message.

ANR0024I

SYMAPI server Enhanced Authentication is ENABLED | DISABLED

**Destination:** Log and console.

**Description:** This message is issued during server initialization to indicate Enhanced User Authentication is enabled or disabled.

- ◆ ENABLED indicates that if a client sends an authentication message it will be verified.
- ◆ DISABLED indicates that if a client sends an authentication message it will not be verified.

**Operator Action:** On non-Windows hosts, if the authentication mode indicated in the message is not the mode desired, verify that the `/etc/krb5.keytab` file exists, that its permissions indicate that `storsrvd` can access it, and verify that the `klist -k` value in the file shows the correct entry for the host. If the conditions are all correct, turn on high levels of diagnostic logging to look for additional information.

ANR0025E

Rejecting session *session\_number* for Host *hostname*: *max\_sessions\_per\_host (limit)* has been reached

**Destination:** Log.

**Description:** A remote client attempts to connect to the server, and the server is tracking concurrent sessions per host using the *max\_sessions\_per\_host* configuration option. The current session exceeds the number of concurrent sessions permitted from a specific host. Therefore the session is rejected. *limit* indicates what the current value of *max\_sessions\_per\_host* is and *session\_number* is the number of the current session. *hostname* names the host from which the session originates. It may be a simple nodename, a Fully-Qualified Domain Name, or an IP address.

**Operator Action:** The user of the client application must wait until the number of concurrent sessions from the specific host falls below the limit set by *max\_sessions\_per\_host*, or the server administrator can raise the *max\_sessions\_per\_host* value or disable concurrent user tracking using the `stordaeomon setvar storsrvd -name max_sessions_per_host` command. See the *EMC VMAX Family Security Configuration Guide* for details on session limits.

## ANR0026E

Rejecting session *session\_number* for User *user*: *max\_sessions\_per\_user (limit)* has been reached

**Destination:** Log.

**Description:** A remote client attempted to connect to the server, and the server is tracking concurrent sessions per user using the *max\_sessions\_per\_user* configuration option. The current session exceeds the number of concurrent sessions permitted from a specific user. Therefore the session is rejected. *limit* indicates the current value of *max\_sessions\_per\_user* and *session\_number* is the number of the current session. *user* is the fully-qualified user name as documented in the *EMC VMAX Family Security Configuration Guide*.

**Operator Action:** The user of the client application must wait until the number of concurrent sessions from the specific user falls below the limit set by *max\_sessions\_per\_user*, or the server administrator can raise the *max\_sessions\_per\_user* value or disable concurrent user tracking using the `stordaeomon setvar storsrvd -name max_sessions_per_user` command. See the *EMC VMAX Family Security Configuration Guide* for details on session limits.

## ANR0027E

Rejecting session *session\_number* for Host *hostname*: *max\_sessions\_per\_user* is zero.

**Destination:** Log.

**Description:** A remote client attempted to connect to the server, and the server is tracking concurrent sessions. Even though *max\_sessions\_per\_host* may not prevent this session from being initialized, the server detected that *max\_sessions\_per\_user* is set to zero, in which case the session will be refused when the server checks the concurrent sessions allowed per user. Therefore the server rejects the session based on this early detection. *session\_number* is the number of the current session, and *hostname* names the host from which the session originates. It may be a simple nodename, a Fully-Qualified Domain Name, or an IP address.

If `max_sessions_per_user` is not set to zero, the concurrent user check is made later in the process, and the session will either be accepted if the session does not exceed the limit set by `max_sessions_per_user`, or refused if it does, in which case the server returns message ANR0026E.

**Operator Action:** When any of the session limit options `max_sessions`, `max_sessions_per_host`, or `max_sessions_per_user` is set to 0, all new sessions attempting to connect to the host are refused. The server administrator can alter any of the options or disable concurrent host and user session tracking using the `stord daemon setvar storsrvd -name max_sessions_XXXX` command. See the *EMC VMAX Family Security Configuration Guide* for details on session limits.

## ANR0030E

Failed to load configuration for *name*

Set Step Return Code

**Destination:** Log and console.

**Description:** This message is issued when an error is detected in the loading of the configuration settings for the SYMAPI server daemon. The instance name is the name of the daemon for which configuration was attempted.

**Operator Action:** Examine the messages that precede this message. A syntax error in the configuration file section for the daemon instance *name* is the most likely cause. For example, the port definition may have specified an invalid number for the port, or an invalid security level may have been specified for the `symapi_security_level` option in the SYMAPI `options` file.

## ANR0031E

The `security_level` (or `-secllevel`) keyword requires a security level to be specified

Set Step Return Code

**Destination:** Log.

**Description:** This `-secllevel` operand was specified without a value on the `stord daemon setvar` command line.

**Operator Action:** If you specify a security level, you must specify a valid value for the security level through the `stord daemon setvar` command. The valid values are NONSECURE, ANY, and SECURE. No abbreviations are accepted.

## ANR0032E

The `-log_filter` keyword requires list of log filter types to be specified

Set Step Return Code

**Destination:** Log.

**Description:** This `-log_filter` operand was specified without a value on the `storsrvd` command line.

**Operator Action:** If you specify `-log_filter`, you must specify the desired list of filter types. Use the `stord daemon getvar storsrvd -name log_categories` for the list of appropriate filter types.

## ANR0033E

The '-port' or 'storsrvd:port' keyword requires a non-zero decimal number less than 65535

Set Step Return Code

**Destination:** Log.

**Description:** An invalid value was specified for the SYMAPI server port. If the `storsrvd` command operand `-port` or the `storsrvd:port` statement is used, the value specified for the port must be a non-zero decimal number less 65535. Many port numbers in the lower ranges must also be avoided since they are used by well known processes (for example, the `inetd` and `ftpd` daemons).

**Operator Action:** Correct the command line or `daemon_options` file specification, and restart the server.

## ANR0034I

The port is not reloaded while the server is running, bypassing any new port definition

**Destination:** Log.

**Description:** During execution of the `reload` command, a change to the port specification was detected. This message is issued to alert the administrator to the fact that the port definition cannot be changed during the reload operation.

**Operator Action:** In order to change the port, you must shut down the `storsrvd` process, make the port change, and restart `storsrvd`.

## ANR0104E

Command syntax error: *explanation*

**Destination:** Log and console.

**Description:** The operator entered a command with invalid syntax explained by *explanation*.

**Operator Action:** Examine the syntax description for the command you want to enter, and re-enter it with the proper operands.

## ANR0105E

Ambiguous or invalid command token entered: *token\_text*

**Destination:** Log and console.

**Description:** The operator entered a command but either the command verb or a keyword name in *token\_text* was misspelled or its abbreviation was too short to uniquely identify the intent.

**Operator Action:** Examine the syntax description for the command you want to enter, and re-enter it with the proper operands.

## ANR0106I

Environment variable *name* has been set to *value*

**Destination:** Console.

**Description:** The operator entered the `SETENV` command, and the environment variable was successfully set.

**Operator Action:** None. This message provides confirmation that the variable was set as intended.

#### ANR0107E

*option* is not a valid runtime option

**Destination:** Log and console.

**Description:** The operator entered the `setvar` command, but the name of the runtime option (*option*) was not recognized as a valid option.

**Operator Action:** Examine the description of the `setvar` command for the supported options. Re-enter the command with the desired option. `setvar` accepts the runtime option names with or without the dash prefix.

#### ANR0108E

*value* is not a valid value for runtime option *option*

**Destination:** Log and console.

**Description:** The operator entered the `setvar` command with the name of a valid runtime option (*option*), but the value (*value*) specified for *option* was not valid.

**Operator Action:** Examine the description of the `setvar` command for the proper values corresponding to each supported option. Re-enter the command with the corrected value for the desired option.

#### ANR0110E

Invalid *option* command option name found following successful parse: decimal value is *code\_value*

**Destination:** Console.

**Description:** This message indicates a programming or environmental error in command parsing and execution. The parsing of the command was successful, but the secondary scan performed by the execution phase found an invalid token.

**Operator Action:** Collect and provide documentation as directed by EMC Customer Support.

#### ANR0111I

*option* runtime option has been set to *value*

**Destination:** Log and console.

**Description:** The operator entered the `setvar` command to change the value of the runtime option *option*. The command text was successfully parsed, and the command was executed successfully. The new value of the variable is *value*.

**Operator Action:** None.

## ANR0112I

*command\_name* command requires additional operands

**Destination:** Console.

**Description:** The operator issued command *command\_name* without sufficient operands. Default processing could not be established.

**Operator Action:** Re-enter the command with desired operands, according to the documentation. You can also use the `help` command to determine the required operands.

## ANR0113I

*option* current value: *value*

**Destination:** Console.

**Description:** This message is issued by the `DISPLAY` or `SHOW` command for a runtime option. The *option* is the runtime option specified in the `SHOW` command, and its current setting is *value*.

**Operator Action:** None. The operator may issue this command before changing the value of a runtime option, or may want to confirm its value after setting it (although message “ANR0111I” can be used for the latter purpose).

## ANR0114I

*environment\_variable* is currently not set

**Destination:** Console.

**Description:** The operator entered the `SHOW -ENV` command to display the value of an environment variable. The variable has not been set.

**Operator Action:** None.

## ANR0115I

*environment\_variable* is set to an empty value

**Destination:** Console.

**Description:** The operator entered the `SHOW -ENV` command to display the value of an environment variable. The variable is set in the environment of the server, but the value is the empty string.

**Operator Action:** None.

## ANR0116I

The *option* runtime option may not be changed while the server is running

**Description:** The operator or `stordaeomon` user issued the `stordaeomon setvar -name` command to change an option which cannot be changed while the server is running.

**Operator Action:** To change the desired option on the next run of `storsrvd`, you can use `stordaeomon setoption` or edit the `daemon_options` file in the SYMAPI configuration directory. If you use the `setoption` command and then try to use `reload`, additional log messages may be issued indicating that some changed options will not be reloaded.

ANR0120I

SYMAPI Active Session List:

**Destination:** Console.**Description:** The operator issued the `LIST SESSIONS` command and there are active sessions to list. This message is the heading for the list of sessions which follows.**Operator Action:** None.

ANR0121I

No active sessions found.

**Destination:** Console.**Description:** The operator issued the `LIST SESSIONS` command or the `SHOW SESSION` command and there are no active sessions to list/show.**Operator Action:** None.

ANR0122I

Session *number* is not active**Destination:** Console.**Description:** The operator issued the `SHOW SESSION` command with the `-NUM` option to display a specific session, and the specified session was not active.**Operator Action:** None.

ANR0123I

Show *server* Details:**Destination:** Console.**Description:** The operator issued the `SHOW -SERVER` command to display the details for the server. This line is written to mark the beginning of the server details output.**Operator Action:** None.

ANR0124I

Show Session details for Session *session\_number* on Thread *thread\_number*:**Destination:** Console.**Description:** The operator issued the `SHOW SESSION` command to display details of one or more currently active sessions. This line is written at the beginning of the details for each session to be displayed.**Operator Action:** None.

ANR0140E

Secure sessions are not supported on this platform. The security level specified is *security\_level*

## Set Step Return Code

**Destination:** Log and console.

**Description:** This message is issued when either the SYMAPI `options` file or `daemon_options` file specified a security level of ANY or SECURE on a platform where secure sessions are not supported. In the case of the `options` file, the `SYMAPI_SERVER_SECURITY_LEVEL=` or the `SYMAPI_SECURITY_LEVEL=` statement specified this value. In the case of the `daemon_options` file, the `storsrvd:security_level` specified ANY or SECURE. The value may have been specified for the `-secllevel` operand of the `storsrvd` command.

---

**Note:** Starting with Solutions Enabler V7.6, `SYMAPI_SERVER_SECURITY_LEVEL` from the SYMAPI `options` file and `storesrvd:security_level` from the `daemon_options` file are deprecated.

---

**Operator Action:** If security level is specified through any configuration statement or `storsrvd` command operand, it must specify NONSECURE on platforms where secure sessions are not supported. It is safer to omit the specification altogether, or to specify the dash character '-'. Refer to the *EMC eLab Navigator* for a list of platforms where secure sessions are supported.

## ANR0141E

Could not extract server *file* filename, rc=*returncode*

**Destination:** Log.

**Description:** During initialization, the SYMAPI server was not able to determine the name of the file to be used in SSL initialization. The string *file* refers to the SSL type file that the server was about to reference. The failing return code is displayed in *returncode*.

**Operator Action:** In an Open Systems environment, the server certificate and private key files should have been installed by the normal installation procedure. In z/OS and Microsoft Windows, the location of the Solutions Enabler configuration directory can be adjusted to your configuration needs. Follow the platform specific installation instructions to install the default server certificate files.

## ANR0142E

*function* establishment failed with rc= *returncode* (*error\_message*)

**Destination:** Log.

**Description:** During SSL initialization, the component referred to by *function* failed to be established. If *function* is CERTIFICATE or PRIVATE KEY, then the `symapisrv_cert.pem` file may be damaged or it may not have been successfully copied to the SYMAPI configuration directory.

**Operator Action:** If server certificate and key files are not installed by default on the platform where the server is running, additional installation steps are necessary. Refer to the platform specific installation instructions to install the files. You can specify NONSECURE for the security level if desired; in which case, the server will not attempt to load the certificate and key files.

## ANR0143E

Rejected session *address*: security level mismatch reason: *error\_message*

**Destination:** Log.

**Description:** A mismatch of security levels occurred when an initiating client session requested a security mode that the server was not able to honor.

*address* is the IP address of the client and *error\_message* contains the error message indicating the actual problem.

**Operator Action:** If possible, modify the security level of the client to match the security mode that the server is using. If that is not possible, then (unless other clients will be impacted), modify the security level of the server to match the security level the client is requesting.

## ANR0144E

Secure Library Init error: rc=*return\_code* (*error\_message*)

**Destination:** Log.

**Description:** Some component failed during SSL initialization. The *return\_code* value corresponds to the message explained in the string *error\_message*.

**Operator Action:** If you are unable to resolve the problem indicated in string *error\_message*, contact EMC technical support for assistance with this error.

## ANR0145E

The value *value* specified for security level is invalid

Set Step Return Code

**Destination:** Log.

**Description:** This message is issued when an attempt is made to set the security level for the SYMAPI server daemon using one of the supported methods, and the value specified is invalid. The methods to set the security level are: the `storesrvd -seclevel` command line option, the `storesrvd:security_level` statement in the `daemon_options` file, or the `stordaeomon setvar` command. The valid values are NONSECURE, ANY, or SECURE. Note that a separate message (“ANR0148E”) is issued if an invalid value is specified in the SYMAPI options file.

---

**Note:** Starting with Solutions Enabler V7.6, `storesrvd:security_level` from the `daemon_options` file is deprecated.

---

**Operator Action:** Correct the value specified on the command line or in the `daemon_options` file, and restart the server or re-execute the `stordaeomon` command.

## ANR0146I

Security level has changed from *old\_security\_level*. New sessions will use *new\_security\_level*

**Destination:** Log.

**Description:** The security level to be used by the server was changed successfully using the `setvar` or `reload` command through the `stord daemon` CLI on the z/OS console. The level was changed from *old\_security\_level* to *new\_security\_level*. New sessions will negotiate based on the new security level set, but existing sessions are unaffected by the new level, and will continue to use the security level negotiated when they started.

**Operator Action:** Confirm that the *new\_security\_level* is the intended security level. If so, no further action is required. If not, you may want to refer to the server logs or other logs to determine why the security level was changed.

## ANR0147I

The SYMAPI options file specified an empty value for `option_name`, changing to platform internal default *security\_level*

**Destination:** Log.

**Description:** A configuration file statement `option_name` specified an empty value for the server security level. Such a specification is an error, but the server will substitute the default security level value with *security\_level* for the platform on which the server is running. The default value is SECURE for platforms that support secure mode and NONSECURE for those platforms that do not support secure mode.

**Operator Action:** The omission of the security level on an explicit configuration is most likely a mistake. Refer to the SYMAPI `options` file or the `daemon_options` file to correct the omission, if you want to suppress the appearance of “ANR0147I”.

---

**Note:** Starting with Solutions Enabler V7.6, `storesrvd:security_level` from the `daemon_options` file is deprecated.

---

## ANR0148E

The SYMAPI option SYMAPI\_SERVER\_SECURITY\_LEVEL specified an invalid value

Set Step Return Code

**Destination:** Log and console.

**Description:** This message is issued during server initialization when an invalid value is specified in the SYMAPI `options` file statement SYMAPI\_SERVER\_SECURITY\_LEVEL or SYMAPI\_SECURITY\_LEVEL. The value for security level can be defined in several places. Here is a list of them and their priorities:

1. Security level defined by the command `stord daemon start storsrvd -args -security_level <security level>`. This takes precedence over everything else.
2. SYMAPI\_SECURITY\_LEVEL defined in the SYMAPI `options` file.
3. SECURITY\_LEVEL defined in the `daemon_options` file.
4. SYMAPI\_SERVER\_SECURITY\_LEVEL defined in the SYMAPI `options` file.

---

**Note:** SECURITY\_LEVEL from the `daemon_options` file and SYMAPI\_SERVER\_SECURITY\_LEVEL from the SYMAPI `options` file are deprecated.

---

Note that a separate message (“ANR0145E”) is issued if an invalid value is specified in any of the other methods: `storsrvd` command line, `daemon_options` file, or the `stord daemon setvar` command.

**Operator Action:** Correct the value specified in the SYMAPI `options` file statement `SYMAPI_SERVER_SECURITY_LEVEL` or `SYMAPI_SECURITY_LEVEL`. The valid values are NONSECURE, ANY, or SECURE. The `SYMAPI_SERVER_SECURITY_LEVEL` statement is now deprecated and replaced by `SYMAPI_SECURITY_LEVEL`. The former statement is still accepted for compatibility reasons.

## ANR0149D

Security level has been taken from the SYMAPI option *value*

**Destination:** Log.

**Description:** This message is issued when the value for the server security level is defined in the SYMAPI `options` file and has not been specified on the `storsrvd` command line. This message is informational only.

*value* is either `SYMAPI_SECURITY_LEVEL` or `SYMAPI_SERVER_SECURITY_LEVEL`.

## ANR0150E

The value *value* specified for client certificate verification is invalid

**Destination:** Log.

**Description:** This message is issued during server initialization when the value for the client certificate verification option, as defined in the `daemon_options` file, is invalid. It can also be issued when attempting to change this option with the `stord daemon` command to an invalid value.

**Operator Action:** Correct the value specified in the `daemon_options` file statement `security_clt_secure_lvl` or as specified on the command line. The valid values are NOVERIFY, VERIFY or MUSTVERIFY.

## ANR0151E

Common Name in client certificate not valid: expected *name*, received *common name*

**Destination:** Log.

**Description:** This message is issued during setup of secure mode between client/server. The common name in the client certificate does not match the name the server is expecting.

**Operator Action:** Check the client certificate to verify that the names contained in the certificate are known hostnames to the server. Either generate a client certificate with the hostname that the server is expecting or add the common name in the client certificate to the applicable `/etc/hosts` file on the server.

## ANR0152E

Issue detected with server certificate file *filename*

**Destination:** Log.

**Description:** This message is issued during initialization of the secure library. A problem with the certificate file has been detected.

**Operator Action:** Check for the existence of the certificate file on the server. If you have set the `security_alt_cert_file` parameter in the `daemon_options` file, verify that it points to a valid file.

## ANR0153E

Issue detected with server PrivateKey file *filename*

**Destination:** Log.

**Description:** This message is issued during initialization of the secure library. A problem with the PrivateKey file has been detected.

**Operator Action:** Check for the existence of the `Privatekey` file on the server. If you have set the `security_alt_key_file` parameter in the `daemon_options` file, verify that it points to a valid file.

## ANR0154E

Host name pattern in certificate is not valid: *pattern* for the client *Host Name*

Set Step Return Code

**Destination:** Log.

**Description:** This message is issued during setup of secure mode between client/server. It indicates an illegal pattern has been put into the client certificate. *Pattern* shows the pattern in the client certificate, and *HostName* shows the name of the client host which was attempting to connect to the server.

**Operator Action:** Generate a new client certificate without the illegal host name pattern. The only characters allowed for a host name pattern are letters, numbers, periods (.), colons (:), and hyphens (-).

## ANR0155E

Subject Alternative Names in the client certificate not valid: expected *name*, received *list*

Set Step Return Code

**Destination:** Log.

**Description:** This message is issued during setup of secure mode between client and server. The list of Subject Alternative Names in the client certificate did not contain a match of the name or IP address that the server is expecting. The name the server expected to find is *name*, but it found the list of Subject Alternative Names in the *list*.

**Operator Action:** Check the client certificate to verify that the names in the certificate are hostnames or IP addresses known to the server. Either generate a client certificate with the hostname that the server is expecting or add the name(s) in the Subject Alternative Name field(s) in the client certificate to the applicable `/etc/hosts` file on the server.

## ANR0156E

Federal Information Processing Standard (FIPS) mode has failed to be enabled

Set Step Return Code

**Destination:** Log.

**Description:** This message is issued during server initialization if the server is configured to run in secure mode on a platform that supports FIPS mode and the server was unable initialize FIPS mode.

**Operator Action:** The details about error conditions will be recorded in the `storsrvd` log files. Refer to the log file for signs of why FIPS mode initialization failed. The most likely cause of the error is that the cryptography library failed to load.

## ANR0200E

*service\_name* error *return\_code*: *explanation*; from *calling\_routine*, line *line\_number*

**Destination:** Log.

**Description:** Server logic called the routine named by *service\_name* and received a failure indicated by *return\_code*, where *explanation* is text that corresponds to the *return\_code*. The failure was detected at line *line\_number* in the routine *calling\_routine*. The routine *calling\_routine* was not able to continue due to the failure of *service\_name*.

**Operator Action:** None, generally. This message may occur in very rare circumstances during handling of an operator command, and may indicate a syntax error that was not handled properly by parsing logic. Examine the command and reissue it if it was specified incorrectly.

## ANR0201E

Unable to allocate *count* bytes for *object\_name*

**Destination:** Log.

**Description:** The server attempted to allocate *count* number of bytes. *object\_name* is a description of what the server was trying to allocate. This message may indicate that the server is over-committed with regard to the number of concurrent sessions, or that there may be a memory leak in the server.

**Operator Action:** Increase the amount of memory available to the server using the appropriate method for the platform the server is running on. If this does not solve the problem, a memory leak may be indicated by other failure messages. Collect and forward error documentation to EMC Customer Support for analysis.

## ANR0202E

Unable to *operation\_name* port *port*, error *error\_number* indicates *explanation*

Set Step Return Code

**Destination:** Log and console.

**Description:** An error occurred operating on the socket on which the server listens for new connections. *operation\_name* will indicate an error during bind, listen, initialize, accept, or start new thread. The *error\_number* is the decimal value of the system error variable *errno* (in Windows, the value returned from the `GetLastError()` call), and the *explanation* is the text that explains the meaning of *error\_number*. *port* is the TCP/IP port which clients use to connect to the SYMAPI server. The server shuts down after issuing this message.

**Operator Action:** In most cases, other messages will also be issued giving other details about an error situation. Follow your normal procedures for detecting and correcting problems in your TCP/IP network. Correct the TCP/IP problem and restart the server.

## ANR0204E

Unable to decode return value *return\_value* from *process*

Set Step Return Code

**Destination:** Log and console.

**Description:** The *return\_value* from a call to a routine or other logic could not be interpreted. *process* may be the name of the function or may be a general description of processing that resulted in a return value which could not be interpreted.

**Operator Action:** None. This message will be preceded by other error messages that provide more detail. If your normal processing is unaffected, no action is necessary. Otherwise, you may need to collect and provide documentation as directed by EMC Customer Support.

## ANR0205E

*action* is not currently supported

**Destination:** Log and console.

**Description:** An action or feature was requested that is either not yet supported or is no longer supported. The name of the action or feature not supported is *action*.

**Operator Action:** None. The feature you requested is not available for use in this release. If you receive this message in error, examine the job log for other evidence of a failure which may be related to the action or feature you attempted to use.

## ANR0207S

Failed to start *name* thread, error = *code* (*explanation*)

Set Step Return Code

**Destination:** Log and console.

**Description:** This message is issued in two cases:

- ◆ During server initialization, the attempt to start the dedicated SYMAPI listener thread failed. In this case, *name* is *SYMAPI Listener*. The server will immediately abort initialization and will stop.
- ◆ During handling of the arrival of a SYMAPI session, the attempt to start a dedicated thread for the session failed. In this case, *name* is *SYMAPI session*. The server continues to listen for other sessions, although the ability to start new threads can be limited. Other messages may accompany this one with additional diagnostic detail. The return code and explanation from the thread-start service call are displayed in *code* and *explanation*.

**Operator Action:** Examine other messages in the log files and other system output. You may be able to determine the cause and corrective action from other messages. In the second case, system resources required to start threads may be exhausted due to the

current SYMAPI session count. Your system may be configured to allow a maximum number of threads per process, and this limit may have been exceeded. Complete diagnosis may require assistance of EMC technical support.

## ANR0208E

Unable to verify SYMAPI Database directory *db\_dir*

Set Step Return Code

**Destination:** Log and console.

**Description:** The server attempts to make the SYMAPI database directory the current directory during initialization in order to cause non-default database files to be placed in the database directory if the name is not a fully-qualified pathname. This message is issued during server initialization if the SYMAPI database directory does not exist or is inaccessible. The most common reason is that the database directory does not exist. The name of the directory the server attempted to verify is shown in *db\_dir*.

**Operator Action:** The Solutions Enabler installation process creates the database directory normally. If this operation failed during installation, the installation process would have terminated with an error. You can create the directory using the tool appropriate to your platform. Use the directory name shown in *db\_dir* in the message text.

## ANR0209I

Authentication service name *service\_name* exceeds maximum length

**Destination:** Log and console.

**Description:** The *storsrvd* process is attempting to copy *service\_name* to an internal structure and is unable to because of its length.

**Operator Action:** If possible, shorten the name of the host shown in *service\_name*. Otherwise, you may need to collect and provide documentation as directed by EMC Customer Support. The server will continue to operate in non-authenticated mode.

## ANR0210E

EMCSAI version does not meet minimum version requirement of *nn.nn.nn*

**Destination:** Log and console.

**Description:** The version of ResourcePak Base running on the host does not meet the minimum version required by Solutions Enabler.

**Operator Action:** Ensure that Solutions Enabler is configured to work with ResourcePak Base at the indicated version or later.

## ANR0211E

Unable to obtain EMCSAI version, RC=%a (%b) EMCRC=%c, EMCRS=%d

**Destination:** Log and, in some cases, the console.

**Description:** This message is issued as a result of an interface error when Solutions Enabler checks the ResourcePak Base version.

Where:

%a is the return code from the call to the ResourcePak Base EMCSAI interface

%b is a text description of the message.

%c is the EMCSAI Return Code (emcrc)

%d is the EMCSAI Reason Code (emcrs)

The most common cause of error is that Solutions Enabler is configured to work with a version of ResourcePak Base which is not running or which does not exist. Either one of these conditions will result in the following message being issued:

ANR0211E Unable to obtain EMCSAI version, RC=28 (Symmetrix Control Facility is not available) EMCRC=0, EMCRS=0

**Operator Action:** In all other cases of the message, contact EMC for support.

## ANR0212E

Unable to determine peer *identifier*, System call: *callname*, RC: *return\_code*

Set Step Return Code

**Destination:** Log and console.

**Description:** During session negotiation, the server attempts to look up the name of the client host which has initiated the session. If the name of the host cannot be determined, the server then attempts to look up the IP address of the client host. The *identifier* will be either “*nodename*” or “*address*” depending on which failure occurs.

Where:

*callname* is the name of the system function called to execute the lookup.

*return\_code* is the failure return code from that function.

**Operator Action:** The session continues to be initiated, if possible. If the session is SECURE, then it's very likely that the validation of the hostname in the certificate will fail, since it is compared to the identifier obtained from the system. If the system cannot return a hostname, DNS and local host TCPIP configuration can be changed to configure a hostname properly. In the rare case that the system cannot obtain an IP address, it is an indication of a severe IP configuration problem. Your network system administrator should be consulted to determine the nature of the network configuration problem.

## ANR0220I

Thread *thread\_number* will execute without condition handling protection

**Destination:** Log.

**Description:** In a z/OS environment, the session on thread *thread\_number* will be executed without the protection of a condition handler. The `setvar -cond_hdlr OFF` command had been previously issued, causing condition handling suppression. This message is a confirmation that the session will be run without protection. An abend on the thread will cause the operating system to terminate the server address space.

You can associate the thread number with a session number by using the `LIST SESSIONS` command. The second column of the list sessions output is the thread number of the session.

**Operator Action:** None.

## ANR0221E

Unable to set condition handling for thread *thread\_number*, msgno=*LE\_message\_num*, sev=*LE\_severity*

**Destination:** Log and console.

**Description:** In a z/OS environment, the thread (*thread\_number*) handling a session attempted to set condition handling by calling the Language Environment routine CEEHDLR but received a non-zero return value from the call. The Language Environment feedback message number is shown in *LE\_message\_number* and the severity of the return is shown in *LE\_severity*.

**Operator Action:** None.

## ANR0222E

ConditionHandler invoked on thread *thread\_number*; writing dump to DD *dump\_location*

or

ConditionHandler invoked on thread *thread\_number*; writing dump to *file\_name* in SYMAPI log directory

**Destination:** Log and console.

**Description:** In a z/OS environment, an abnormal condition was raised during the session running on *thread\_number*. A dump will be written to the DD name *dump\_location*. The general format of the DD name is DMPnnnnn where *nnnnn* is the *thread\_number*.

If you prefer that the dump be written to a file instead of to the spool, you can use DD SYM\$ENV in the server's JCL and add this environment variable:

```
SYMAPI_LE_DUMP_LOGDIR = 1
```

After this variable is set, if an abnormal condition were to arise during the session running on *thread\_number*, a file *file\_name* will be written to the Solutions Enabler log directory. The general format of the file name is DMPnnnnn where *nnnnn* is the *thread\_number*.

**Operator Action:** Consult EMC Customer Support for directions on completing documentation to provide for analysis and correction.

## ANR0223E

Dump to *dump\_location* is complete; thread *thread\_number* will be terminated

or

Dump to *file\_name* in SYMAPI log directory is complete; thread *thread\_number* will be terminated

**Destination:** Log and console.

**Description:** This message should immediately follow "ANR0222E". It denotes that the dump whose beginning is marked by the previous "ANR0222E" message is now complete. And the dump is written to either DD name *dump\_location* or a file named *file\_name* in SYMAPI log directory. Furthermore, thread *thread\_number* that caused this dump will be terminated.

**Operator Action:** None.

#### ANR0224S

Recursive entry to condition handler on thread *thread\_number*

**Destination:** Log and console.

**Description:** In a z/OS environment, condition handling processing detected a recursive (second) entry into the condition handling routine. This may indicate an abend while attempting to handle an earlier abend.

**Operator Action:** None.

#### ANR0225E

Condition handling is not supported on this platform

**Destination:** Log.

**Description:** In a z/OS environment, language environment *condition handling* supports capturing abnormal termination of a thread without affecting other threads in the process (job). This message is issued when an attempt is made to set or display the current condition handling setting in a non-z/OS environment, using the `stord daemon getvar` or `setvar` command.

**Operator Action:** Correct the `setvar` or `getvar` command to specify an option which is supported in the environment where you are using the `stord daemon` command.

#### ANR0300E

API Request code *SYMAPI\_request\_code API\_name* rejected; it is restricted and disabled

**Destination:** Log.

**Description:** A SYMAPI request code that describes a control operation was received. The server checked the *SYMAPI\_request\_code* (function named in *API\_name*) to determine whether execution has been disabled. The API request was found to be disabled. This message will only be issued in the z/OS environment.

**Operator Action:** None. In a z/OS environment, control operations may have been disabled by using the installation job #12CNTRL in the Solutions Enabler RIMLIB dataset.

#### ANR0301I

API Request code *SYMAPI\_request\_code API\_name* executing

**Destination:** Log.

**Description:** The server received a SYMAPI request described by the decimal code *SYMAPI\_request\_code*. This message is issued when the server begins executing the API request. The name of the SYMAPI function name is *API\_name*.

**Operator Action:** None.

#### ANR0302I

API Request code *SYMAPI\_request\_code* complete, processing status *SYMAPI\_return\_code (explanation)*

**Destination:** Log.

**Description:** The API request named in message ANR03011 completed executing. The decimal code of *SYMAPI\_request\_code* corresponds to the API request code. The return value of the API request was *SYMAPI\_return\_code*, and the corresponding text is *explanation*.

**Operator Action:** None.

ANR03031

Executing SymExit to clean up (client exited without calling SymExit)

**Destination:** Log.

**Description:** The client application exited its process before calling SymExit to end the remote session with the SYMAPI server. The server calls SymExit on behalf of the client to free up resources which are still held.

**Operator Action:** None.

ANR03041

Cleanup SymExit return: *return\_value* (*explanation*)

**Destination:** Log.

**Description:** The cleanup call to SymExit completed, and the return value was *return\_value*. The *explanation* is the text associated with *return\_value*.

**Operator Action:** None.

ANR0305E

REMOTE\_CACHED mode not supported for client node *Host\_name* version *client\_version\_number*- connection rejected

**Destination:** Log.

**Description:** A client running a version of Solutions Enabler earlier than V7.2 attempted to connect to a SYMAPI server running V7.6 or higher, which is not allowed.

**Operator Action:** None.

ANR0306E

Connection rejected from client node *HostName*-- its version (*version*) is no longer supported in C/S mode

**Destination:** Log.

**Description:** Client connections using SYMAPI versions lower than V7.2 are not supported. *Hostname* is the name of the client host where the connection originated, and *version* is the version of the SYMAPI library with which the client program was built.

**Operator Action:** The developer of the application must upgrade to a newer version of the SYMAPI library. If the client program is the SymCLI, there may be an incorrect version installed on the client host, or the client may intend to connect to a different server.

## ANR0307E

Connection rejected from client node hostname -- its version (*HostName*) is newer than our version

**Destination:** Log.

**Description:** The SYMAPI version of the client program is newer than the server's version. Such a connection is not supported. *HostName* is the name of the client host where the connection originated, and *version* is the version of the SYMAPI library with which the client program was built.

**Operator Action:** Insure the client program is directing its connection request to the correct server.

# APPENDIX B

## Asynchronous Events

This appendix lists the possible asynchronous error and message events trapped by the event daemon:

- ◆ [Array event codes.....](#) 264
- ◆ [Event daemon events: Event IDs 0-199.....](#) 265
- ◆ [Array Events: Event IDs 1050 - 1199.....](#) 266
- ◆ [Array Events: Event IDs 1200-1999.....](#) 267

## Array event codes

The descriptions in this appendix is focused on running the event daemon in a logging mode - where events are automatically forwarded to a file on disk, syslog, SNMP, or the Windows Event Service.

Events below are described in the following format:

⟨Event-ID⟩	⟨Event-Name⟩
Category	⟨Event-Category⟩
Component	⟨Event-Component⟩
Severity	⟨Event-Severity⟩
Message	⟨Event-Message⟩

Where:

⟨Event-ID⟩	The event ID - from the SYMAPI_AEVENT2_UID_T enumeration in symapi.h
⟨Event-Name⟩	The internal name for this event.
⟨Event-Category⟩	The category that this event belongs to, if any. Registering against a category has the effect of registering for all events that belong to that category.
⟨Event-Component⟩	The component, if one is known, that the event is delivered with. For Event Logging (to file, Syslog, SNMP, Windows Events), the component will only be present if a specific component (for example: a specific device, disk, pool, ...) is known. <sup>1</sup>
⟨Event-Severity⟩	The severity that the event is delivered with: Fatal, Critical, Major, Minor, Warning, Info or Normal.
⟨Event-Message⟩	The message that the event is delivered with.

1. The system ignores leading zero(es) when matching device numbers in event registrations against those in delivered events. That means if you register for events on device 01234 or 001234, events for device 1234 will be received.

Unless all events are delivered with an Entity-Name set to the Symmetrix ID that relates to the event.

## Classes of Events

There are 3 general types of events:

- ◆ **“Event daemon events: Event IDs 0-199”** — Events in this range (there are only a handful) are generated by the event daemon itself - and reflect conditions within it.

These are described below.

- ◆ **“Array Events: Event IDs 1050 - 1199”** — Events in this range correspond to entries retrieved from the 'Error' log on a storage array. Some of these are informational in nature; others correspond to actual errors.
- ◆ **“Array Events: Event IDs 1200-1999”** — Events in this range are manufactured by the event daemon itself based on its regular polling of conditions on a storage array.

## Severity Calculation for status/state events

For a number of the array status events, an event severity is calculated dynamically from the status of the component in question (or overall array). In most cases, the mapping to severity is as follows:

Severity	Meaning
Normal	The component is now (back) in a normal state of operation.
Info	The component is no longer present (during certain operations).
Warning	The component is in a degraded sate of operation. The storage array is no longer present (during certain operations). The component is in an unknown state. The component is (where possible) in a write-disabled state.
Major	The component is offline.
Fatal	The component is in a dead or failed state.

## Event daemon events: Event IDs 0-199

Events in this range are generated by the event daemon - and reflect its internal state.

They are automatically delivered to any registered applications as needed. There is no need to explicitly register for them.

### 1

1	SYMAPI_AEVENT2_UID_EVT_RESTARTED
Category	
Component	
Severity	Warning
Message	event daemon restarted; events may have been lost.

### Notes

Generated when the event daemon is restarted after a crash.

## 2

2	SYMAPI_AEVENT2_UID_EVT_EVENTS_LOST
Category	
Component	
Severity	Warning
Message	event daemon communications problem; events may have been lost.

## Notes

Generated when the event daemon encounters a communication problem attempting to send events back to a client.

## 3

3	SYMAPI_AEVENT2_UID_EVT_EVENTS_OVERFLOW
Category	
Component	
Severity	Warning
Message	Event Queue overflow; events may have been lost.

## Notes

Generated when one of the internal Event Queues (within a client process or event daemon) overflows and events are discarded.

## Array Events: Event IDs 1050 - 1199

Events in this range correspond to entries retrieved from the Error log on a storage array. Some of these are informational in nature; others correspond to actual errors.

These correspond to events returned by the `symevent` SYMCLI command.

There are a number of categories that can be used to register for a related subset of these events.

- array subsystem
- db checksum
- diagnostic
- environmental
- device pool
- service processor
- srdf system

srdf link  
 srdfa session  
 srdf consistency group  
 director  
 device  
 disk

## Array Events: Event IDs 1200-1999

Events in this range are manufactured by the event daemon itself based on its regular polling of conditions on a storage array.

There are two categories that can be used to register for a related of these events:

- ◆ status
- ◆ optimizer

### 1200

1200	SYMAPI_AEVENT2_UID_ALERT_DEV_STATUS								
Category	status								
Component	Device number Device =1234								
Severity	<table style="border: none;"> <tr> <td>If Online</td> <td>Normal</td> </tr> <tr> <td>If Online Degraded</td> <td>Warning</td> </tr> <tr> <td>If Offline</td> <td>Major</td> </tr> <tr> <td>If Not Present</td> <td>Info</td> </tr> </table>	If Online	Normal	If Online Degraded	Warning	If Offline	Major	If Not Present	Info
If Online	Normal								
If Online Degraded	Warning								
If Offline	Major								
If Not Present	Info								
Message	Device state has changed to Online [Degraded, RG-Mbr-Rebuild-or-Copy.								

### Notes

- ◆ 'Not Present' means that the device could not be seen by Solutions Enabler.
- ◆ 'Online' means that the device service state is normal.
- ◆ 'Online [Degraded]' means one or more of the device's mirrors are in a Not-Ready state.
- ◆ 'Offline' means that the device service state is failed.

## 1201

<b>1201</b>	<b>SYMAPI_AEVENT2_UID_ALERT_ARRAY_STATUS</b>										
Category	status										
Component											
Severity	<table> <tr> <td>If Online</td> <td>Normal</td> </tr> <tr> <td>If Online Degraded</td> <td>Warning</td> </tr> <tr> <td>If Offline</td> <td>Major</td> </tr> <tr> <td>If Not Present</td> <td>Warning or Major (depending on situation)</td> </tr> <tr> <td>If Unknown</td> <td>Warning or Major (depending on situation)</td> </tr> </table>	If Online	Normal	If Online Degraded	Warning	If Offline	Major	If Not Present	Warning or Major (depending on situation)	If Unknown	Warning or Major (depending on situation)
If Online	Normal										
If Online Degraded	Warning										
If Offline	Major										
If Not Present	Warning or Major (depending on situation)										
If Unknown	Warning or Major (depending on situation)										
Message	Array state has changed to Not Present   Unknown   Online   Online Degraded   Offline										

### Notes

- ◆ This event reflects the overall state of the array - including its Disks, Directors, Ports.
- ◆ 'Not Present' means that the array couldn't be seen by Solutions Enabler.
- ◆ 'Online' means that the array is operational.
- ◆ 'Online [Degraded]' means that:
  - One or more Ports are in an Offline or Write-Disabled state.
  - One or more Directors are in an Offline or Dead state.
  - Device events [1200] events are also enabled and one or more device is in a Not-Ready state.
  - Array sub-component events [1404] are also enabled and one or more are in a failed (Offline) state (Fans, Power Supplies, LCCs, MIBEs, Enclosures, etc.).
- ◆ 'Unknown' means that there was a problem communicating with the array.

## 1202

<b>1202</b>	<b>SYMAPI_AEVENT2_UID_ALERT_DIRECTOR_STATUS</b>										
Category	status										
Component	Director identifier For example: Director=SA-03C										
Severity	<table> <tr> <td>If Online</td> <td>Normal</td> </tr> <tr> <td>If Online Degraded</td> <td>Warning</td> </tr> <tr> <td>If Offline</td> <td>Major</td> </tr> <tr> <td>If Failed</td> <td>Fatal</td> </tr> <tr> <td>If Not Present</td> <td>Info</td> </tr> </table>	If Online	Normal	If Online Degraded	Warning	If Offline	Major	If Failed	Fatal	If Not Present	Info
If Online	Normal										
If Online Degraded	Warning

Message	Director state has changed to Not Present   Online   Online Degrade]   Offline   Failed										

### Notes

- ◆ 'Not Present' means the director was not seen by Solutions Enabler.

- ◆ 'Online' means that the director status is Online.
- ◆ 'Online [Degraded]' means that one or more of the director's ports were in an Offline or Write-Disabled state.
- ◆ 'Offline' means that the director status is Offline.
- ◆ 'Failed' means that the director status is Dead.

## 1203

<b>1203</b>	<b>SYMAPI_AEVENT2_UID_ALERT_PORT_STATUS</b>										
Category	status										
Component	Port identifier For example: Port=SA-03C:2 (for Port 2 on Director SA-03C)										
Severity	<table style="border: none;"> <tr> <td>If Online</td> <td>Normal</td> </tr> <tr> <td>If Offline</td> <td>Major</td> </tr> <tr> <td>If Write Disabled</td> <td>Warning</td> </tr> <tr> <td>If Unknown</td> <td>Warning</td> </tr> <tr> <td>If Not Present</td> <td>Info</td> </tr> </table>	If Online	Normal	If Offline	Major	If Write Disabled	Warning	If Unknown	Warning	If Not Present	Info
If Online	Normal										
If Offline	Major										
If Write Disabled	Warning										
If Unknown	Warning										
If Not Present	Info										
Message	Port state has changed to Not Present   Unknown   Online   Write Disabled   Offline										

Indicates that the status for some Director Port has changed.

### Notes

- ◆ 'Not Present' means the port was not seen.
- ◆ 'Online' means a port status of On.
- ◆ 'Offline' means a port status of Off.
- ◆ 'Write Disabled' means a port status of Write-Disabled.

**1204**

<b>1204</b>	<b>SYMAPI_AEVENT2_UID_ALERT_DISK_STATUS</b>
Category	status
Component	Spindle ID (Disk identifier is supported for internal disks only) For example: Disk=123 or Disk=16B:C2 (for Director 16B, DA Interface C, SCSI ID/Target 2) (internal disks only)
Severity	If Online                      Normal If Online Spare              Normal If Online Degraded         Warning If Offline                      Warning If Offline Spare              Warning If Not Present                Info
Message	Disk state is now <State> (was: <State>). Where State can be: Online Offline Online Spare Offline Spare Online Degraded Not Present

**Notes**

- ◆ 'Not Present' means that the disk could not be seen by Solutions Enabler.
- ◆ 'Online' means that one or more of the disk's Hypers are in a Ready state.
- ◆ 'Online Spare' means that the disk is a Spare and one or more of the disk's Hypers are in a Ready state.
- ◆ 'Online [Degraded]' means that the disk can only be reached via a single array DS controller. This disk state is for external disk only and supported with Enginuity 5876 and later.
- ◆ 'Offline' means that all of the disk's Hypers are in a Not-Ready state.
- ◆ 'Offline Spare' means that the disk is a Spare and all of the disk's Hypers are in a Not-Ready state

## 1205

<b>1205</b>	<b>SYMAPI_AEVENT2_UID_ALERT_DEV_CONFIG_CHANGE</b>
Category	status
Component	Device number For example: Device=1234
Severity	Info
Message	Device configuration has changed.

Indicates that the configuration of some device has changed.

## Notes

- ◆ The following aspects of a device's configuration is considered by this event:
  - The base device configuration.
  - The meta configuration of the device (META\_HEAD, META\_MEMBER).
  - The bound-vs-bound state of a TDEV (bound vs unbound).
  - Whether a dynamic spare disk is invoked for the device.
  - The RDF mode of the device (of either leg for Concurrent SRDF).
  - The data pool bound to by a TDEV changes. This reflects a device being bound, unbound or re-bound to a different pool, and is also triggered when the name of the pool changes.

## 1206

<b>1206</b>	<b>SYMAPI_AEVENT2_UID_ALERT_POOL_STATUS</b>
Category	status
Component	Pool name For example: SnapPool=Sales, DSEPool=Finance, TPDataPool=Eng
Severity	If Online                      Normal If Online Degraded        Warning If Offline                      Major If Not Present                Info
Message	Snap Savedev Pool state has changed to Not Present   Online   Online Degraded   Offline SRDF/A DSE Pool state has changed to Not Present   Online   Online Degraded   Offline Data Pool state has changed to Not Present   Online   Online Degraded   Offline

Indicates that the status of a Snap, SRDF/A DSE or ThinData Pool has changed.

## Notes

- ◆ 'Not Present' means that the pool no longer exists.
- ◆ 'Online' means that the pool is in an enabled state.
- ◆ 'Online [Degraded]' means that the pool is in a mixed state.
- ◆ 'Offline' means that the pool is in a disabled state.

## 1207

<b>1207</b>	<b>SYMAPI_AEVENT2_UID_ALERT_POOL_CONFIG_CHANGE</b>
Category	status
Component	Pool name For example: SnapPool=Sales, DSEPool=Finance, TPDataPool=Eng
Severity	Info
Message	Snap Savedev Pool configuration has changed. SRDF/A DSE Pool configuration has changed. Data Pool configuration has changed.

Indicates that the configuration of a Snap, SRDF/A DSE or ThinData Pool has changed.

## Notes

- ◆ A pool's configuration changes if:
  - The set of Enabled devices in the pool changes.
  - The total size (free + used) of all the Enabled devices in the pool changes.

## 1208

<b>1208</b>	<b>SYMAPI_AEVENT2_UID_THRESH_POOL_FREESPACE</b>
Category	status
Component	Pool name For example: SnapPool=Sales, DSEPool=Finance, TPDataPool=Eng
Severity	Determined by Threshold values. See below.
Message	Snap Savedev Pool utilization is now <NN> percent. SRDF/A DSE Pool utilization is now <NN> percent. Data Pool utilization is now <NN> percent.

This is a Threshold event that reflects the amount (as a percentage) of used space within a pool.

Unless threshold values are supplied with the registration, the following defaults are used to derive an event severity:

If value is 100% — Fatal

If value is  $\geq 80\%$  — Critical  
 If value is  $\geq 70\%$  — Major  
 If value is  $\geq 65\%$  — Minor  
 If value is  $\geq 60\%$  — Warning  
 Otherwise — Normal

## Notes

- ◆ Used space size is determined by calls to SymPoolShow().
- ◆ Events are only delivered at multiples of 5% ... for  $\langle NN \rangle$  equal to 5%, 10%, 15%, ... , 75%, 80%, 85%, 90%, 95% and 100%.
- ◆ Threshold events are only delivered when the severity, as determined by threshold values, changes.

## 1209

<b>1209</b>	<b>SYMAPI_AEVENT2_UID_ALERT_SEL_CHANGE</b>
Category	status
Component	Symmetrix Lock Number For example: SEL=15
Severity	Info
Message	Symmetrix External Lock has been acquired. Symmetrix External Lock has been released.

Indicates that the state (released vs acquired) of one of the monitored Symmetrix External Locks (SELs) has changed.

## Note

At this time, only SEL #15 (used by Config Change) is monitored.

**1210**

<b>1210</b>	<b>SYMAPI_AEVENT2_UID_ALERT_HOTSPARE_CHANGE</b>
Category	status
Component	Disk identifier of the Spare For example: Disk=16B:C2 (for Director 16B, DA InterfaceC, SCSI ID/Target 2)
Severity	For 5x74 and newer arrays: Normal For older arrays: If invoked                      Warning If no longer invoked        Normal
Message	For 5x74 and newer arrays: Disk is no longer a Spare. Disk is now a Spare. Disk is now an invoked Spare.  For older arrays: Spare has been invoked against a failed disk. Spare is no longer invoked against a failed disk.

Indicates that a disk has started or stopped acting as a spare.

**Note**

With Permanent Sparing on newer arrays, a failing disk and a spare will exchange roles. The failed disk will end up as a failed spare, and the spare will end up as a normal disk. The “Disk is now an invoked Spare” event will rarely if ever be delivered.

**1211**

<b>1211</b>	<b>SYMAPI_AEVENT2_UID_ALERT_NUM_HOTSPARES_T</b>
Category	
Component	
Severity	Determined by Threshold values. See below.
Message	Number of available disk spares is <NN>.

This is a Threshold event that reflects the number of available Spare Disks on the storage array.

Unless threshold values are supplied with the registration, the following defaults are used to derive an event severity:

- If value is 0 — Critical
- If value is 1 — Major
- If value is 2 — Warning
- Otherwise — Info

## Note

Threshold events are only delivered when the severity, as determined by threshold values, changes.

## 1212

1212	SYMAPI_AEVENT2_UID_THRESH_TDEV_ALLOCATED
Category	
Component	Device number For example: Device=1234
Severity	Determined by Threshold values. See below.
Message	Thin Device is now <NN> percent allocated.

This is a Threshold event that reflects the amount (as a percentage) of a Thin Device that is backed by space in a Data Pool.

Unless threshold values are supplied with the registration, the following defaults are used to derive an event severity:

- If value is 100% — Fatal
- If value is  $\geq$  80% — Critical
- If value is  $\geq$  70% — Major
- If value is  $\geq$  65% — Minor
- If value is  $\geq$  60% — Warning
- Otherwise — Normal

## Notes

- ◆ Events are only delivered at multiples of 5% ... for <NN> equal to 5%, 10%, 15%, ... , 75%, 80%, 85%, 90%, 95% and 100%.
- ◆ Threshold events are only delivered when the severity, as determined by threshold values, changes.

## 1213

1213	SYMAPI_AEVENT2_UID_THRESH_TDEV_USED
Category	
Component	Device number For example: Device=1234
Severity	Determined by Threshold values. See below.
Message	Thin Device is now <NN> percent allocated.

This is a Threshold event that reflects the amount (as a percentage) of a Thin Device that has been written to.

Unless threshold values are supplied with the registration, the following defaults are used to derive an event severity:

- If value is 100% — Fatal
- If value is  $\geq$  80% — Critical
- If value is  $\geq$  70% — Major
- If value is  $\geq$  65% — Minor
- If value is  $\geq$  60% — Warning
- Otherwise — Normal

## Notes

- ◆ Events are only delivered at multiples of 5% ... for  $\langle NN \rangle$  equal to 5%, 10%, 15%, ... , 75%, 80%, 85%, 90%, 95% and 100%.
- ◆ Threshold events are only delivered when the severity, as determined by threshold values, changes.

## 1214

1214	SYMAPI_AEVENT2_UID_ALERT_DIRECTOR_CONFIG_CHANGE
Category	status
Component	Director
Severity	Info
Message	Director configuration has changed.

Indicates that the configuration changed for a Director.

## 1215

1215	SYMAPI_AEVENT2_UID_ALERT_PORT_CONFIG_CHANGE
Category	status
Component	Port For example: Port=SA-03C:2(for Port 2 on Director SA-03C)
Severity	Info
Message	Port configuration has changed.

Indicates that the configuration changed for a Port on a Front End (FE) Director.

## Notes

- ◆ The only aspects of a port's configuration that are considered the following flags from the FA port flags:
- ◆ The `_VCM_ENABLED` flag.

- ◆ The `_VOL_SET_ADDR` (VSA) flag.

## 1216

<b>1216</b>	<b>SYMAPI_AEVENT2_UID_ALERT_POOL_DEV_STATE_CHANGE</b>
Category	status
Component	Pool name For example: SnapPool=Sales , DSEPool=Finance , TPDataPool=Eng
Severity	Info
Message	Snap Savedev Pool device state has changed. SRDF/A DSE Pool device state has changed. Data Pool device state has changed.

Indicates that the state of a device in a Snap, SRDF/A DSE or ThinData Pool has changed.

## 1217

<b>1217</b>	<b>SYMAPI_AEVENT2_UID_DFR_SVC_STATE</b>
Category	status
Component	
Severity	If the replacement threshold has been exceeded      Warning Otherwise      Info
Message	The deferred services replacement threshold has been exceeded - service is required. The deferred services replacement threshold is no longer exceeded.

Indicates that the Deferred Service replacement threshold indicator for a storage array has changed. This change can be in either direction – from not-exceeded to exceeded ... or from exceeded to not-exceeded.

### Note

- ◆ This event will only be generated if Deferred Service is enabled for the storage array.

**1218**

<b>1218</b>	<b>SYMAPI_AEVENT2_UID_DEV_CFG_CHKSUM</b>
Category	status
Component	Device number For example: Device=1234
Severity	Info
Message	The device configuration checksum has changed.

Indicates that the configuration of a device has changed. The implementation makes use of a checksum maintained by the event daemon over a device's core configuration data. An event is generated when this checksum changes.

**1219**

<b>1219</b>	<b>SYMAPI_AEVENT2_UID_MIGRATE_COMPLETE</b>
Category	status
Component	Migrate Session name For example: MigrSess=jones17
Severity	If success      Info If terminated    Info If timed out     Warning If failed        Major
Message	The migrate operation is complete: success. The migrate operation is complete: timed out. The migrate operation is complete: terminated. The migrate operation is complete: failed.

Indicates that a VLUN migration has completed or failed.

**Note**

- ◆ This is only generated for explicitly initiated VLUN migrations – not movements being performed by FAST.

**1220**

<b>1220</b>	<b>SYMAPI_AEVENT2_UID_POOL_REBAL_COMPLETE</b>
Category	status
Component	The Data Pool name. For example: TPDataPool=Eng
Severity	If success        Info If terminated    Info If timed out      Warning If failed         Major
Message	Thin Pool rebalancing operation is complete: success. Thin Pool rebalancing operation is complete: timed out. Thin Pool rebalancing operation is complete: terminated. Thin Pool rebalancing operation is complete: failed.

Indicates that a Thin Pool rebalancing activity has completed.

**Note**

This event is only supported for Symmetrix arrays running Engenuity 5875.

**1230**

<b>1230</b>	<b>SYMAPI_AEVENT2_UID_ALERT_ARRAY_CONFIG_CHANGE</b>
Category	status
Component	
Severity	Info
Message	Array configuration has changed.

Indicates that some change has been made to the configuration of the storage array.

**Note**

This event is derived from one of the QuickConfig indication maintained on the storage array.

**1231**

<b>1231</b>	<b>SYMAPI_AEVENT2_UID_ALERT_MASKING_CHANGE</b>
Category	status
Component	
Severity	Info
Message	Device Masking database has changed.

Indicates that some change have been made to the device masking database on the storage array.

## Note

This event is derived from one of the QuickConfig indication maintained on the storage array.

**1232**

<b>1232</b>	<b>SYMAPI_AEVENT2_UID_ALERT_ACCESS_CONTROL_CHANGE</b>
Category	status
Component	
Severity	Info
Message	Access Control definitions have changed.

Indicates that some change has been made to the Access Control [symacl] database on the storage array.

## Note

This is derived from one of the QuickConfig indication maintained on the storage array.

**1233**

<b>1233</b>	<b>SYMAPI_AEVENT2_UID_ALERT_DYNAMIC_RDF_CONFIG</b>
Category	status
Component	
Severity	Info
Message	Dynamic RDF operation performed on device.

Indicates that a dynamic RDF operation has been performed on some device.

## Note

This is derived from one of the QuickConfig indication maintained on the storage array.

**1234**

<b>1234</b>	<b>SYMAPI_AEVENT2_UID_ALERT_SNAP_CLONE_CONFIG</b>
Category	status
Component	
Severity	Info
Message	Snap session created, activated or deleted.

Indicates that a snap / clone session has been created, activated or deleted.

## Note

This is derived from one of the QuickConfig indication maintained on the storage array.

**1235**

<b>1235</b>	<b>SYMAPI_AEVENT2_UID_ALERT_BCV_CONTROL_CONFIG</b>
Category	status
Component	
Severity	Info
Message	BCV device pairing has changed.

Indicates that the BCV pairing for some device has changed.

## Note

This is derived from one of the QuickConfig indication maintained on the storage array.

**1236**

<b>1236</b>	<b>SYMAPI_AEVENT2_UID_ALERT_DEV_NAME_HP_ID_CONFIG</b>
Category	status
Component	
Severity	Info
Message	HPUX device identifier has changed.

Indicates that the HPUX device identifier for some device has been changed.

## Note

This is derived from one of the QuickConfig indication maintained on the storage array.

**1237**

<b>1237</b>	<b>SYMAPI_AEVENT2_UID_ALERT_DEV_NAME_CONFIG</b>
Category	status
Component	
Severity	Info
Message	Device Name has changed.

Indicates that the device name for some device has been changed.

## Note

This is derived from one of the QuickConfig indication maintained on the storage array.

**1238**

<b>1238</b>	<b>SYMAPI_AEVENT2_UID_ALERT_DEV_NICE_NAME_CONFIG</b>
Category	status
Component	
Severity	Info
Message	Device Nice Name has changed.

Indicates that the device nice name for some device has been changed.

**Note**

This is derived from one of the QuickConfig indication maintained on the storage array.

**1239**

<b>1239</b>	<b>SYMAPI_AEVENT2_UID_ALERT_DEV_NAME_VMS_ID_CONFIG</b>
Category	status
Component	
Severity	Info
Message	OpenVMS device identifier has changed.

Indicates that the OpenVMS device identifier for some device has been changed.

**Note**

This is derived from one of the QuickConfig indication maintained on the storage array.

**1240**

<b>1240</b>	<b>SYMAPI_AEVENT2_UID_DEVICE_RESV_CHANGE</b>
Category	
Component	
Severity	Info
Message	Device Reservations data has changed.

Indicates that the Device Reservation state for some device on the storage array has changed.

**Note**

This event requires checking for modifications to file(s) within SFS.

## 1241

1241	SYMAPI_AEVENT2_UID_SRDFA_CYCLE_TIME_T
Category	
Component	The SRDF Group. For example: SRDF-grp=13
Severity	Determined by Threshold values. See below.
Message	Time since last SRDFA cycle switch exceeds minimum cycle time by <NN> seconds.

This is a Threshold event that indicates the amount (in seconds) by which an SRDFA Group's Cycle Time exceeds the minimum that is configured.

Unless threshold values are supplied with the registration, the following defaults are used to derive an event severity:

If value is  $\geq 5$  — Warning

Otherwise — Info

## Notes

This is determined by calling `SymReplicationGet()` and examining the `time_since_last_switch` and `duration_of_last_cycle` quantities for Active, R1, non-MSD sessions.

The event value corresponds to the number of seconds that the larger of these two is beyond the configured `min_cycle_time`. If the time(s) are less than `min_cycle_time` (everything normal), the event value is 0. To protect against rounding problems, the test is actually against `min_cycle_time+1`. If the times are less than `min_cycle_time+1`, the event value will be 0. Therefore, possible event values are: 0, 2, 3, 4, 5, etc.

For example, assuming a `min_cycle_time` of 10:

<code>time_since_last_switch</code>	event value
9	0
10	0
11	0
13	3

## 1242

1242	SYMAPI_AEVENT2_UID_SRDFA_WP_CACHEUSE_T
Category	
Component	
Severity	Determined by Threshold values. See below.
Message	SRDFA cycles now using <NN> percent of the cache available for it.

This is a Threshold event that indicates the percentage of cache that is available for SRDFA use that is actually holding SRDFA Write Pending data.

Unless threshold values are supplied with the registration, the following defaults are used to derive an event severity:

If value is  $\geq 90\%$  — Warning

Otherwise — Info

## Notes

- ◆ This is determined by calling `SymReplicationGet()` and summing the `active_cycle_size` and `inactive_cycle_size` values for all active R1 or R2 sessions. The maximum available cache is computed in the usual manner:

```
if ((max_host_throttle == 0) and
    (rdfa_max_cache_usage > 0) and
    (rdfa_max_cache_usage < 100))
    max_avail = (max_wr_pend_slots * rdfa_max_cache_usage) / 100
else
    max_avail = max_wr_pend_slots
```

The event value is the sum of the active and inactive cycle sizes expressed as a percentage of this max avail cache size.

- ◆ **warning:** Exercise caution when assigning significance to this event. The fact that an amount of cache is available for SRDFA to use (`max_avail` above) doesn't mean that it is guaranteed to be available for its use. There are other sources of Write Pending data that can use up this space as well - leaving it unavailable for SRDFA's use.

## 1243

<b>1243</b>	<b>SYMAPI_AEVENT2_UID_WP_CACHEUSE_T</b>
Category	
Component	
Severity	Determined by Threshold values. See below.
Message	Write Pending data is now using <NN> percent of the cache.

## Notes

This is a Threshold event that indicates the percentage of Symmetrix Cache that is holding Write Pending data.

Unless threshold values are supplied with the registration, the following defaults are used to derive an event severity:

If value is  $\geq$  90% — Warning

Otherwise — Info

## 1244

<b>1244</b>	<b>SYMAPI_AEVENT2_UID_ALERT_ARR_COMP_STATUS</b>
Category	
Component	Power=xxx Fan=xxx LCC=xxx Enclosure=xxx MM=xxx IOMC=xxx Dir=xxx
Severity	If Online                    Normal If Online Degraded        Warning If Offline                    Major If Unknown                  Warning
Message	Component state has changed to Online   Online Degraded   Offline   Unknown

## Notes

Indicates a change in environmental status for one of the following types of sub-components within the VMAX array:

Fans	[ Fan ]
Power Supplies	[ Power ]
Link Control Cards	[ LCC ]
Management Modules	[ MM ]
IO Module Carriers	[ IOMC ]
Directors (for environmental alerts)	[ Dir ]
Enclosures or Matrix Interface Board Enclosures	[ Enclosure ]

- ◆ 'Online' means that the component is a Normal or Degraded state.
- ◆ 'Online [Degraded]' means that the component is in a degraded state.
- ◆ 'Offline' means that the component is in a Failed state.

The format of the specific component name ('xxx' above) may differ depending on the VMAX model. Some examples you might encounter are:

SB-1/Fan-A	Fan in System Bay
SB-1/ENC-1	Enclosure within System Bay
SB-1/ENC-1/Fan-A	Fan in Enclosure-Slot within System Bay
SB-1/MIBE-L-2A	MIBE within System Bay
SB-1/MIBE-L-2A/PS-A	Power Supply in MIBE within System Bay

## 1245

1245	SYMAPI_AEVENT2_UID_DSE_SPILL_TIME_T
Category	
Component	The SRDF Group. For example: SRDF-grp=13
Severity	Determined by Threshold values. See below.
Message	DSE Spillover has been occurring on the RDF group for <N> minutes. or DSE Spillover is no longer occurring on the RDF group.

This is a Threshold event that indicates the amount of time (in minutes) that SRDF DSE Spillover has been occurring for.

Unless threshold values are supplied with the registration, the following defaults are used to derive an event severity:

- If value is  $\geq 30$  (minutes) — Warning
- Otherwise — Normal

### Note

Threshold events are only delivered when the severity, as determined by threshold values, changes.

**1246**

<b>1246</b>	<b>SYMAPI_AEVENT2_UID_ALERT_DISK_GRP_CHG</b>
Category	
Component	The Symmetrix Disk group number (decimal). For example: DiskGrp=2
Severity	INFO
Message	Disk Group has changed. or Disk Group has been deleted or Disk Group has been created

**Note**

This event is only supported on VMAX arrays running Engenuity 5876 and HYPERMAX OS 5977.

**1247**

<b>1247</b>	<b>SYMAPI_AEVENT2_UID_ALERT_DISK_SPARE_CVG</b>
Category	
Component	Disk identifier For example: Disk=16B:C2 (for Director 16B, DA InterfaceC, SCSI ID/Target 2)
Severity	INFO
Message	Disk has spare coverage. or Disk no longer has spare coverage.

**Note**

This event is only supported on VMAX arrays running Engenuity 5876 and HYPERMAX OS 5977.

**1248**

<b>1248</b>	<b>SYMAPI_AEVENT2_UID_ALERT_DISK_SPARE_PCT_CHNG</b>
Category	
Component	The Symmetrix Disk group number (decimal). For example: DiskGrp=2
Severity	INFO
Message	The spare capacity percentage for diskgroup on engine %d has changed

## Note

This event is only supported on VMAX arrays running HYPERMAX OS 5977.

**1280**

<b>1280</b>	<b>SYMAPI_AEVENT2_UID_ALERT_CACHE_PART_CHANGE</b>
Category	
Component	
Severity	Info
Message	Cache Partitioning configuration has changed.

Indicates that the Cache Partitioning data on the array has been changed.

## Note

This is derived from one of the QuickConfig indication maintained on the VMAX array.

**1281**

<b>1281</b>	<b>SYMAPI_AEVENT2_UID_ALERT_DYNAMIC_MAPPING_CHANGE</b>
Category	
Component	
Severity	Info
Message	Dynamic Mapping configuration for a device has changed.

Indicates that the Dynamic Mapping info for some device has been changed on the VMAX array.

## Note

This is derived from one of the QuickConfig indications maintained on the VMAX array.

**1282**

<b>1282</b>	<b>SYMAPI_AEVENT2_UID_ALERT_META_CONFIG_CHANGE</b>
Category	
Component	
Severity	Info
Message	Meta configuration for a device has changed.

Indicates that the Meta configuration for some device has been changed on the VMAX array.

**Note**

This is derived from one of the QuickConfig indications maintained on the VMAX array.

**1283**

<b>1283</b>	<b>SYMAPI_AEVENT2_UID_ALERT_INITIATOR_GRP_CHANGE</b>
Category	
Component	
Severity	Info
Message	Initiator Group has changed.

Indicates that some Initiator Group on the array has been changed.

**Note**

This is derived from one of the QuickConfig indication maintained on the VMAX array.

**1284**

<b>1284</b>	<b>SYMAPI_AEVENT2_UID_ALERT_STORAGE_GRP_CHANGE</b>
Category	
Component	
Severity	Info
Message	Storage Group has changed.

Indicates that some Storage Group on the array has been changed.

**Note**

This is derived from one of the QuickConfig indication maintained on the VMAX array.

**1285**

<b>1285</b>	<b>SYMAPI_AEVENT2_UID_ALERT_DIR_PORT_GRP_CHANGE</b>
Category	
Component	
Severity	Info
Message	Director Port Group has changed.

Indicates that some Director Port Group on the array has been changed.

**Note**

This is derived from one of the QuickConfig indication maintained on the VMAX array.

**1286**

<b>1286</b>	<b>SYMAPI_AEVENT2_UID_ALERT_MASKING_VIEW_CHANGE</b>
Category	
Component	
Severity	Info
Message	Masking View has changed.

Indicates that some Masking View on the array has been changed.

**Note**

This is derived from one of the QuickConfig indication maintained on the VMAX array.

**1287**

<b>1287</b>	<b>SYMAPI_AEVENT2_UID_ALERT_FEAT_REG_CHANGE</b>
Category	
Component	
Severity	Info
Message	Feature Registration DB has changed.

Indicates that a change has been made to the Feature Registration DataBase on the VMAX array.

**Note**

This is derived from one of the QuickConfig indication maintained on the VMAX array.

**1288**

<b>1288</b>	<b>SYMAPI_AEVENT2_UID_ALERT_APP_REG_CHANGE</b>
Category	
Component	
Severity	Info
Message	Application Registration DB has changed.

Indicates that a change has been made to the Application Registration DataBase on the VMAX array.

## Note

This is derived from one of the QuickConfig indication maintained on the VMAX array.

**1289**

<b>1289</b>	<b>SYMAPI_AEVENT2_UID_ALERT_TIERS_CHANGE</b>
Category	
Component	
Severity	Info
Message	FAST tiers have changed.

Indicates that a change has been made to the FAST (Fully Automated Storage Tiering) Tiers on the VMAX array.

## Note

This is derived from one of the QuickConfig indication maintained on the VMAX array.

**1290**

<b>1290</b>	<b>SYMAPI_AEVENT2_UID_ALERT_FAST_POLICY_CHANGE</b>
Category	
Component	
Severity	Info
Message	FAST policies have changed.

Indicates that a change has been made to the FAST (Fully Automated Storage Tiering) Policies on the VMAX array.

## Note

This is derived from one of the QuickConfig indication maintained on the VMAX array.

**1291**

<b>1291</b>	<b>SYMAPI_AEVENT2_UID_ALERT_FAST ASSOCS_CHANGE</b>
Category	
Component	
Severity	Info
Message	FAST associations have changed.

Indicates that a change has been made to the FAST (Fully Automated Storage Tiering) Associations on the VMAX array.

**Note**

This is derived from one of the QuickConfig indication maintained on the VMAX array.

**1292**

<b>1292</b>	<b>SYMAPI_AEVENT2_UID_ALERT_FAST_TIME_WDS_CHANGE</b>
Category	
Component	
Severity	Info
Message	Optimizer/FAST time windows have changed.

Indicates that a change has been made to the FAST (Fully Automated Storage Tiering) time windows on the VMAX array.

**Note**

This is derived from one of the QuickConfig indication maintained on the VMAX array.

**1293**

<b>1293</b>	<b>SYMAPI_AEVENT2_UID_ALERT_FAST_CTL_PARMS_CHANGE</b>
Category	
Component	
Severity	Info
Message	Optimizer/FAST control parameters have changed.

Indicates that a change has been made to the FAST (Fully Automated Storage Tiering) control parameters on the VMAX array.

**Note**

This is derived from one of the QuickConfig indication maintained on the VMAX array.

**1294**

<b>1294</b>	<b>SYMAPI_AEVENT2_UID_ALERT_SG_CONFIG_CHANGE</b>
Category	
Component	
Severity	Info
Message	Storage group configuration has changed

Indicates that a change has been made to a storage group on the VMAX array.

**Note**

This is derived from one of the QuickConfig indication maintained on the VMAX array.  
This event is only supported with HYPERMAX OS 5977.

**1295**

<b>1295</b>	<b>SYMAPI_AEVENT2_UID_ALERT_IG_CONFIG_CHANGE</b>
Category	
Component	
Severity	Info
Message	Initiator group configuration has changed

Indicates that a change has been made to an initiator group on the VMAX array.

**Note**

This is derived from one of the QuickConfig indication maintained on the VMAX array.  
This event is only supported with HYPERMAX OS 5977.

**1296**

<b>1296</b>	<b>SYMAPI_AEVENT2_UID_ALERT_PG_CONFIG_CHANGE</b>
Category	
Component	
Severity	Info
Message	Port group configuration has changed

Indicates that a change has been made to a port group on the VMAX array.

**Note**

This is derived from one of the QuickConfig indication maintained on the VMAX array.

This event is only supported with HYPERMAX OS 5977.

## 1297

<b>1297</b>	<b>SYMAPI_AEVENT2_UID_ALERT_MV_CONFIG_CHANGE</b>
Category	
Component	
Severity	Info
Message	Masking view configuration has changed

Indicates that a change has been made to a masking view configuration on the VMAX array.

### Note

This is derived from one of the QuickConfig indication maintained on the VMAX array.  
This event is only supported with HYPERMAX OS 5977.

## 1298

<b>1298</b>	<b>SYMAPI_AEVENT2_UID_ALERT_SG_SCOPE_CHANGE</b>
Category	
Component	
Severity	Info
Message	Storage group scope has changed

Indicates that a change has been made to a storage group scope on the VMAX array.

### Note

This is derived from one of the QuickConfig indication maintained on the VMAX array.  
This event is only supported with HYPERMAX OS 5977.

## 1299

<b>1299</b>	<b>SYMAPI_AEVENT2_UID_ALERT_IG_SCOPE_CHANGE</b>
Category	
Component	
Severity	Info
Message	Initiator group scope has changed

Indicates that a change has been made to an initiator group scope on the VMAX array.

## Note

This is derived from one of the QuickConfig indication maintained on the VMAX array.  
This event is only supported with HYPERMAX OS 5977.

## 1300

<b>1300</b>	<b>SYMAPI_AEVENT2_UID_ALERT_MV_SCOPE_CHANGE</b>
Category	
Component	
Severity	Info
Message	Masking view scope has changed

Indicates that a change has been made to a masking view scope on the VMAX array.

## Note

This is derived from one of the QuickConfig indication maintained on the VMAX array.  
This event is only supported with HYPERMAX OS 5977.

## 1400

<b>1400</b>	<b>SYMAPI_AEVENT2_UID_AUTHZ_RULES_CHANGED</b>
Category	
Component	
Severity	Info
Message	User Authorization rules have changed.

Indicates that a change has been made to the User Authorization [symauth] database on the VMAX array.

## Note

This is determined by checking for modifications to the User Authorization file stored in SFS.

## 1401

<b>1401</b>	<b>SYMAPI_AEVENT2_UID_AUDIT_LOG_SIZE_T</b>
Category	
Component	
Severity	Determined by Threshold values. See below.
Message	Audit log is at <NN> percent of capacity (before wrapping).

This is a threshold event that tracks as a percentage the amount of data in an array Audit Log - how close the log is to its *wrapping* point where existing entries begin to be over-written.

Unless threshold values are supplied with the registration, the following defaults are used to derive an event severity:

If value is  $\geq 80\%$  — Warning

Otherwise — Normal

### Notes

- ◆ What is actually reported is the position of the write pointer within the Audit Log as a percentage: 0% for the beginning, 100% for the end.
- ◆ This event is intended to be used as an indication that a backup of the Audit Log is needed - if appropriate.

## 1402

<b>1402</b>	<b>SYMAPI_AEVENT2_UID_ALERT_SEC_AUDIT</b>
Category	
Component	
Severity	Info
Message	<< The actual message from the Audit Record >>

Indicates that a security-related record was written to the array Audit Log.

### Notes

- ◆ This event is delivered when audit records with an Audit Class of SECURITY are detected in the Audit Log.
- ◆ The audit message is a free-form string that may span multiple lines (containing multiple new line characters).

**1403**

<b>1403</b>	<b>SYMAPI_AEVENT2_UID_ALERT_SEC_FAIL_AUDIT</b>
Category	
Component	
Severity	Info
Message	« The actual message from the Audit Record »

Indicates that a Security alert was written to the array Audit Log.

**Notes**

- ◆ This event is delivered when audit records corresponding to one of the following are detected in the Audit Log:
- ◆ Access Control failures (host based access control, symacl).
- ◆ User Authorization failures (user based access control, symauth).
- ◆ SymmWin / SSC Logon failures.
- ◆ SymmWin Logins
- ◆ iSCSI authorization failures
- ◆ The audit message is a free-form string that may span multiple lines (containing multiple new line characters).

**1404**

<b>1404</b>	<b>SYMAPI_AEVENT2_UID_ALERT_ALL_AUDIT</b>
Category	
Component	
Severity	Info
Message	« The actual message from the Audit Record ».

Indicates some (any) record written to the array Audit Log.

**Note**

The audit message is a free-form string that may span multiple lines (containing multiple new line characters).

**1500**

<b>1500</b>	<b>SYMAPI_AEVENT2_UID_ALERT_OPTMZ_SWAP_ACT</b>
Category	Optimizer
Component	
Severity	Info
Message	Optimizer Swap activity (from Audit Log).

Indicates some Optimizer Swap activity.

**Note**

This is derived by detecting a record written by the Optimizer to the array Audit Log.

**1501**

<b>1501</b>	<b>SYMAPI_AEVENT2_UID_ALERT_OPTMZ_MOVE_ACT</b>
Category	Optimizer
Component	
Severity	Info
Message	Optimizer Move activity (from Audit Log).

Indicates some Optimizer Move activity.

**Note**

This is derived by detecting a record written by the Optimizer to the array Audit Log.

**1502**

<b>1502</b>	<b>SYMAPI_AEVENT2_UID_ALERT_OPTMZ_SCHEDULE</b>
Category	Optimizer
Component	
Severity	Info
Message	Optimizer configuration change (from Audit Log).

Indicates some Optimizer configuration change.

**Note**

This is derived by detecting a record written by the Optimizer to the array Audit Log.

**1503**

<b>1503</b>	<b>SYMAPI_AEVENT2_UID_ALERT_FAST_SWAP_ACT</b>
Category	Optimizer
Component	
Severity	Info
Message	FAST Controller Swap activity (from Audit Log).

Indicates some FAST Controller activity.

**Note**

This is derived by detecting a record written by the Optimizer to the array Audit Log.

**1504**

<b>1504</b>	<b>SYMAPI_AEVENT2_UID_ALERT_FAST_MOVE_ACT</b>
Category	Optimizer
Component	
Severity	Info
Message	FAST Controller Move activity (from Audit Log).

Indicates some FAST Controller Move activity.

**Note**

This is derived by detecting a record written by the Optimizer to the array Audit Log.

**1505**

<b>1505</b>	<b>SYMAPI_AEVENT2_UID_ALERT_FAST_SCHEDULE</b>
Category	Optimizer
Component	
Severity	Info
Message	FAST Controller configuration change (from Audit Log).

Indicates some FAST Controller configuration change.

**Note**

This is derived by detecting a record written by the Optimizer to the array Audit Log.

**1506**

<b>1506</b>	<b>SYMAPI_AEVENT2_UID_ALERT_OPTMZ_RB_ACT</b>
Category	Optimizer
Component	
Severity	Info
Message	Optimizer Rollback activity (from Audit Log).

## Note

This is derived by detecting a record written by the Optimizer to the array Audit Log.

**1507**

<b>1507</b>	<b>SYMAPI_AEVENT2_UID_ALERT_OPTMZ_APPRVL_NEEDED</b>
Category	
Component	
Severity	Info
Message	User approval is required for a Config Change plan generated by the Optimizer/FAST Controller.

## Note

Indicates that user approval of the a swap state is required and user approval is required.

## 1508

<b>1508</b>	<b>SYMAPI_AEVENT2_UID_ALERT_FAST_STATE_SWITCH</b>
Category	Optimizer
Component	
Severity	Info
Message	<p>The FAST (DP or VP) controller has switched to state: <i>&lt;current_state&gt;</i> (was: <i>&lt;previous_state&gt;</i>).</p> <p>Where <i>&lt;current_state&gt;</i> and <i>&lt;previous_state&gt;</i> can be one of the following possible values:</p> <ul style="list-style-type: none"> <li>• Disabled</li> <li>• Enabled</li> <li>• Disable in progress</li> <li>• Enable in progress</li> <li>• Disable with error</li> <li>• Degraded</li> </ul>

## Note

Indicates that the FAST state has changed from a previous state to the current state.

## 1509

<b>1509</b>	<b>SYMAPI_AEVENT2_UID_ALERT_OPTMZ_MODE_SWITCH</b>
Category	Optimizer
Component	
Severity	Info
Message	The Optimizer has switched to a different mode.

## Note

Indicates that the Optimizer status state has changed.

**1510**

<b>1510</b>	<b>SYMAPI_AEVENT2_UID_ALERT_FAST_ALLOC_CHANGE</b>
Category	Optimizer
Component	<policy_name>
Severity	Info
Message	The combined allocation in pools has changed.

**Note**

This event checks for allocated capacity change of all associated pools under the same FAST VP policy. And as such, if FAST VP policy is accidentally used, this event will never be generated.

**1511**

<b>1511</b>	<b>SYMAPI_AEVENT2_UID_ALERT_FAST_TIER_PERF_CHANGE</b>
Category	Optimizer
Component	<tier_name>
Severity	Info
Message	FAST Tier (<tier_name>) is performing as expected (NORMAL). or FAST Tier (<tier_name>) is performing worse than expected (LOW).

**Note**

This event is only supported with Enginuity 5876 Q42012 SR and above.

**1512**

<b>1512</b>	<b>SYMAPI_AEVENT2_UID_ALERT_FAST_SRP_ALLOC_CHANGE</b>
Category	Optimizer
Component	<SRP_name>
Severity	Determined by Threshold values. See below.
Message	The allocation for SRP has changed to <NN> %u percent.

Unless threshold values are supplied with the registration, the following defaults are used to derive an event severity:

If value is 100% — Fatal

If value is  $\geq 80\%$  — Critical  
 If value is  $\geq 70\%$  — Major  
 If value is  $\geq 65\%$  — Minor  
 If value is  $\geq 60\%$  — Warning  
 Otherwise — Normal

## Notes

- ◆ Events are only delivered at multiples of 5% ... for  $\langle NN \rangle$  equal to 5%, 10%, 15%, ... , 75%, 80%, 85%, 90%, 95% and 100%.
- ◆ Threshold events are only delivered when the severity, as determined by threshold values, changes.
- ◆ This event is only supported with HYPERMAX OS 5977.

## 1600

<b>1600</b>	<b>SYMAPI_AEVENT2_UID_GROUP_CONFIG</b>
Category	
Entity	Not set -- set to NULL.
Component	DG or CG group. For example: DG=prod17 or CG=prod18
Severity	Info
Message	Group has changed.

Indicates that the composition of a device group (DG) or composite group (CG) has changed.

## Notes

- ◆ The Entity name and type (normally a Symmetrix ID) are not provided for this event. When registering to receive the event, there is no need to supply an ID (symid=000194900123) - if one is supplied, it will be ignored.
- ◆ If GNS is not enabled, this event indicates that a group definition in the Solutions Enabler DB file on this host has changed.
- ◆ If GNS is enabled, this event indicates that a global group definition stored within GNS (on storage arrays) has changed.

# APPENDIX C

## UNIX Native Installation Support

This appendix describes how to install/upgrade Solutions Enabler using UNIX PureNative installation kits:

- ◆ [Before you begin .....](#) 306
- ◆ [PureNative installation kits .....](#) 306
- ◆ [Installing Solutions Enabler.....](#) 308
- ◆ [Uninstalling Solutions Enabler .....](#) 313

## Before you begin

Before you begin to install/upgrade Solutions Enabler, be sure to complete the tasks listed in this section.

- ❑ Review the following best practices:
  - Backup persistent data and uninstall previous versions of Solutions Enabler before performing major upgrades.
  - Use the response file method for mass deployments.
  - The automated installers: Kickstart, Jumpstart, and Ignite are recommended.
  - To achieve full installation functionality, use the Solutions Enabler installation wrapper script.
- ❑ For AIX and Solaris hosts with GPG installed, import the public key and verify the digital signature:
  - a. Locate the public key (`public_key`) and the signature. For example, the digital signature for AIX is:
 

```
SYMCLI.8.0.3.0.bff.sig
```
  - b. Import the key, by entering:
 

```
gpg --import public_key
```
  - c. Verify the imported key using, by entering:
 

```
-bash-3.00# gpg --list-key
```
  - d. Edit the imported key and trust it ultimately, by entering:
 

```
-bash-3.00# gpg --edit-key C4E34013
```
  - e. Verify the digital signatures, by entering:
 

```
gpg --verify SigFile
```

Where *SigFile* is the name of the digital signature.

For example, to verify the digital signature for AIX, enter:

```
gpg --verify SYMCLI.8.0.3.0.bff.sig
```
- ❑ For Linux hosts, import the ascii public key, by entering:
 

```
rpm --import sepupkey.asc
```

## PureNative installation kits

Solutions Enabler PureNative kits are available for the following UNIX platforms:

- ◆ AIX
- ◆ HP-UX (PA/RISC and ia64)
- ◆ Linux (ia64, PPC64, and 390)
- ◆ Solaris (SunOS Sparc and SunOS x86)

The kits use the following naming convention:

```
seMmPp-OS-ARCH-ni.tar.gz
```

Where:

*M* = Major version

*m* = Minor version

*P* = Point

*p* = Patch

*OS* = Operating System

*ARCH* = Processor architecture

For example:

`se8030-SunOS-sparc-ni.tar.gz`

[Table 43 on page 307](#) lists the kit components by operating system.

**Note:** N/A indicates that the component is not supported in the corresponding operating system.

Components within shaded rows are required.

**Table 43** Solutions Enabler PureNative kit contents (page 1 of 2)

OS-specific component names				Description
AIX	HP-UX	Linux	SunOS	
SYMCLI.DATA.rte	SYMCLI.DATA	symcli-data	SYMdse	Installs persistent data files and SSL certificate files.
			SYMse	Installs Solutions Enabler program files for Solaris platforms (sparc and X86). This holds sub components like SRM, JNI, etc.
SYMCLI THINCORE.rte	SYMCLI.THINCORE	symcli-thincore	N/A	Installs Solutions Enabler thin core functionality.
SYMCLI.BASE.rte	SYMCLI.BASE	symcli-base	N/A	Installs: <ul style="list-style-type: none"> <li>Solutions Enabler core functionality, including <code>symapi</code>, <code>symlvm</code>, <code>storapi</code>, <code>storapid</code>, <code>storcore</code>, <code>stordaemon</code>, and <code>storpds</code></li> <li>Storage Resource Management base mapping library</li> <li>Shared libraries and runtime environment, including Base Storage Library component and Control Storage Library component</li> </ul> This option is part of the shared library runtime environment. It is a core requisite for other options, and is therefore mandatory for a successful installation.
SYMCLI.CERT.rte	SYMCLI.CERT	symcli-cert	N/A	Installs SSL certificate files.

**Table 43** Solutions Enabler PureNative kit contents (continued) (page 2 of 2)

OS-specific component names				Description
AIX	HP-UX	Linux	SunOS	
SYMCLI.SYMCLI.rte	SYMCLI.SYMCLI	symcli-symcli	N/A	Installs the collection of binaries known as Symmetrix Command Line Interface (SYMCLI).
SYMCLI.SYMRECOVER.rte	SYMCLI.SYMRECOVER	symcli-symrecover	N/A	Installs the SRDF session recovery component.
N/A	N/A	symcli-smi	N/A	Installs the SMI Provider.
N/A	N/A	symcli-vss	N/A	Installs the VSS Provider.
SYMCLI.SRM.rte	SYMCLI.SRM	symcli-srm	N/A	Installs: <ul style="list-style-type: none"> <li>• The shared libraries and runtime environment - base mapping component.</li> <li>• The Oracle daemon.</li> <li>• The SRM SYBASE database runtime component.</li> <li>• The SRM IBM UDB database runtime component.</li> </ul>
SYMCLI.JNI.rte	SYMCLI.JNI	symcli-jni	N/A	Installs the Solutions Enabler Java interface component. You should install this component if your Solutions Enabler installation uses the Java interface.
SYMCLI.64BIT.rte	SYMCLI.64BIT	symcli-64bit <sup>a</sup>	N/A	Installs the 64-bit libraries.

a. Only for Linux X64.

## Installing Solutions Enabler

This section describes how to install/upgrade Solutions Enabler using native installer commands.

### Installing on AIX

To install on an AIX host:

1. Uncompress and untar the installation kit.
2. Do either of the following depending on whether you want to perform a full or customized installation:

- To perform a full installation, run the following command:

```
installp -ac -d absolute_path_to_SYMCLI*.bff_file
all
```

- To perform a custom installation and install only specific components, run the following command:

```
installp -a -d absolute_path_to_SYMCLI*.bff_file FileSetName
```

Where *FileSetName* is a component name from [Table 43 on page 307](#).

3. Run the following command to verify the component installation:

```
lppchk -f FileSetName
```

A 0 value is returned for a successful installation.

4. Repeat steps 2 and 3 for each component to install.

## Installing on HP-UX

You can install Solutions Enabler on a HP-UX host using either a command line option or a response file.

### Using the command line

To install on an HP-UX host using the command line:

1. Uncompress and untar the installation kit.
2. From the local file system, run the following commands to start the installation:

```
swreg -l depot AbsolutePathtoSYMCLI.depot
```

```
swinstall -s AbsolutePathtoSYMCLI.depot FileSetName:InstallPath
```

Where *FileSetName* is a component name from [Table 43 on page 307](#).

3. Repeat step 2 for each component to install.

### Using a response file

To install on an HP-UX host using a response file:

1. Create a response file similar to the following:

```
#cat response_file_bin
SYMCLI.THINCORE:/opt/emc
SYMCLI.BASE:/opt/emc
SYMCLI.SRM:/opt/emc
SYMCLI.SYMCLI:/opt/emc
SYMCLI.SYMRECOVER:/opt/emc
SYMCLI.JNI:/opt/emc
SYMCLI.64BIT:/opt/emc
```

```
#cat response_file_data
SYMCLI.DATA:/usr/emc
SYMCLI.CERT:/usr/emc
```

2. Run the following command, specifying the location of the installation package and the name of your response file:

```
swinstall -s AbsolutePathtoSYMCLI.depot
-f ResponseFile
```

## Installing on Linux

You can install Solutions Enabler on a Linux host using either RPM, a response file, or Yum.

## Using RPM

To install on a Linux host using the command line:

1. Uncompress and untar the installation kit.
2. Run the following command to start the installation:

```
rpm -i symcli*8.0.3*.rpm
```

3. Run the following command to verify the component installation:

```
rpm -qa | grep symcli
```

4. Run the following command to verify the component installation:

```
rpm -i symcli*8.0.3*.rpm
```

5. Run the following command to set lockbox password:

```
/usr/symcli/install/set_lockbox.sh
```

## Using a response file

To install on a Linux host using a response file:

1. Create a response file similar to the following in

```
/usr/temp/emc_se_linux_response_file:
```

```
-bash-2.05b# cat emc_se_linux_response_file
EMC_APPLICATION_PATH:/opt/emc
EMC_VAR_PATH:/usr/emc
ADDITIONAL_COMPONENTS:jni srm
```

2. Run the following command to start the installation:

```
rpm -i symcli*8.0.3*.rpm
```

3. Run the following command to verify the installation:

```
rpm -qa | grep symcli
```

## Using Yum

To install on a Linux host using Yum:

1. Run the following command to create a directory for the Solutions Enabler repository:

```
mkdir /symapi.repo
```

2. Change directory to the Solutions Enabler repository:

```
cd /symapi.repo
```

3. Depending on whether the kit is in the form of a tar ball or an RPM, run the following command to extract all files into the Solutions Enabler repository:

- If in a tar ball, run:

```
tar -xvf se803*-Linux-*.tar
```

- If in an RPM, run:

```
rpm2cpio symcli*8.0.3*.rpm | cpio -id
mv kit_arch_dir/*.rpm current_working_dir
rm -rf kit_arch_dir
```

4. Verify that the rpm files (components) and an XML file are extracted into the `/symapi.repo` directory. For file names and descriptions, refer to [Table 43 on page 307](#).
5. Run the following command to create Yum Solutions Enabler repository:
 

```
createrepo -g symapi.xml /symapi.repo
```
6. Run the following command to add the Solutions Enabler repository into the Yum repositories:
 

```
cat > /etc/yum.repos.d/symapi.repo << EOF
[symapi]
baseurl=file:///symapi.repo
enabled=1
gpgcheck=0
EOF
```
7. Run the following command to start the installation:
 

```
yum groupinstall SYMAPI -y
```

## Installing on Solaris

You can install/upgrade Solutions Enabler on a Solaris host using either a command line option, or a response file.

### Using the command line

To install on a Solaris host using the command line:

1. Uncompress and untar the installation kit.
2. Run the following command to view a list of packages:
 

```
pkgadd -d .
```
3. Run the following, depending on whether you want to start an interactive or silent installation:

Interactive: `pkgadd -d . PkgName`  
`pkgadd -G -d . PkgName` (on Solaris 10 or higher)

Silent: `pkgadd -n -d . -a Full_path_to_ADMINFile`  
`-r ResponseFile PkgName`

```
pkgadd -G -n -d . -a Full_path_to_ADMINFile -r
ResponseFile PkgName (on Solaris 10 or higher)
```

Where *ResponseFile* is the name of your response file and *PkgName* is a component name from [Table 43 on page 307](#).

The Solutions Enabler Solaris installation kit consists of two components: SYMdse and SYMse. SYMdse contains persistent data files and SYMse contains program files. SYMse accommodates classes (sub components), which are used to custom-install required Solutions Enabler features like SRM, JNI, etc., using a response file.

Install the components in the following order:

SYMdse

```
SYMse
```

4. Run the following command to verify the installation:

```
pkgchk -f PkgName
```

A 0 value is returned for a successful installation.

5. Repeat steps 3 and 4 for each component to install.

## Using a response file

To install on Solaris host using a response file:

1. Uncompress and untar the installation kit.
2. Create a response file similar to the following:

```
-bash-2.05b# cat response_file_bin
CLASSES=none thincore base symcli symrecover srm 64bit jni
BASEDIR=/opt/emc
```

```
-bash-2.05b# cat response_file_data
CLASSES=none data cert
BASEDIR=/usr/emc
```

3. Create the following admin file:

```
#cat admin_file
mail=
basedir=default
runlevel=quit
conflict=nocheck
setuid=nocheck
action=nocheck
partial=nocheck
instance=overwrite
idepend=quit
rdepend=quit
space=quit
```

4. Run the following command to start the installation:

```
pkgadd -n -d . -a Full_path_to_ADMINFile -r ResponseFile PkgName
```

```
pkgadd -G -n -d . -a Full_path_to_ADMINFile -r ResponseFile PkgName
(on Solaris 10 or higher)
```

Where *ResponseFile* is the name of your response file and *PkgName* is a component name from [Table 43 on page 307](#).

5. Install the components in the following order:

```
data
cert
thincore
base
symcli
symrecover
srm
64bit
jni
```

---

**Note:** For component descriptions, refer to [Table 43 on page 307](#).

---

6. Run the following command to verify the installation:

```
pkginfo
```

7. Repeat steps 2 through 6 for each component to install.

## Uninstalling Solutions Enabler

This section describes how to uninstall Solutions Enabler using native installer commands.

### Uninstalling from AIX

To uninstall from an AIX host, run the following command:

```
installp -u FileSetName
```

Where *FileSetName* is a component name from [Table 43 on page 307](#).

### Uninstalling from HP-UX

To uninstall from an HP-UX host, run the following command:

```
swremove FileSetName
```

Where *FileSetName* is a component name from [Table 43 on page 307](#).

### Uninstalling from Linux

To uninstall from a Linux host, run the following command:

```
rpm -e `rpm -qa |grep -i symcli`
```

### Uninstalling from Solaris

To uninstall from a Solaris host, run the following, depending on whether you want to start an interactive or silent uninstall:

Interactive: `pkgrm PkgName`

Silent: `pkgrm -n -a Full_path_to_ADMINFile PkgName`

Where *PkgName* is a component name from [Table 43 on page 307](#).

# APPENDIX D

## Host Issues

This section describes the issues in running Solutions Enabler on various hardware platforms. You will find additional information in the Release Notes, which are distributed in hard copy with the Solutions Enabler kits.

The information in this section is organized by hardware platform and operating system:

- ◆ [General issues](#) ..... 316
- ◆ [HP-UX-specific issues](#)..... 316
- ◆ [HP OpenVMS-specific issues](#)..... 320
- ◆ [IBM AIX-specific issues](#) ..... 320

## General issues

This section describes issues that apply to all supported platforms.

### Host system semaphores

---

**Note:** This section only applies if you manually changed the `storapid:use_all_gks` to disabled in the `daemon_options` file. Otherwise, this section may be skipped.

---

In UNIX and Linux environments, Solutions Enabler uses semaphores to serialize access to the gatekeeper devices. You or the System Administrator may need to optimize the host system semaphore parameter settings. When optimizing the semaphore parameters, the following values are recommended:

- ◆ `semnmi` — Specifies the number of semaphore identifiers for the host. Solutions Enabler requires one identifier for each gatekeeper, and one for each SYMAPI database. The minimum recommended value for this parameter is 256.
- ◆ `semmns` — Specifies the number of semaphores for the host. Solutions Enabler requires one semaphore for each gatekeeper, and one for each SYMAPI database. The minimum recommended value for this parameter is 256.
- ◆ `semnmu` — Specifies the number of undo structures for the host. Solutions Enabler requires one undo structure for each gatekeeper, and one for each SYMAPI database. The minimum recommended value for this parameter is 256.
- ◆ `semume` — Specifies the number of undo structures per process. The minimum recommended value for this parameter is 256.

### RDF daemon thread requirements

The RDF daemon allocates threads based on the number of locally attached Symmextrix arrays visible to its host. On some host operating system configurations the default number of threads allowed per process may not be enough to accommodate the RDF daemon's requirements. Although the exact number of threads needed for a given daemon cannot be exactly predicted, the recommended practice is to allow 16 threads per locally attached VMAX array.

## HP-UX-specific issues

This section describes the HP-UX system issues concerned with compatibility with the SYMCLI/SYMAPI database file, gatekeeper, and BCV device requirements.

### Creating pseudo-devices for gatekeepers and BCVs

If the device you want to use as a gatekeeper or BCV device is accessed through the HP-PB (NIO) SCSI bus controller and you want the device to be visible to your host, you must create a pseudo-device for that device. (A pseudo-device is necessary for every device you want visible to the host.)

---

**Note:** Your HP-UX operating system may require a patch to support the HP-PB (NIO) SCSI board. Patches for the HP-PB SCSI Pass-Thru driver (spt0) are available for HP-UX V11.20 and higher from HP on an Extension Media CD. Consult your HP representative about spt drivers for your specific system.

---

---

**Note:** If your HP system is configured with an HSC fast-wide differential SCSI interface board and a device accessed through the HSC SCSI bus is available, you can specify the gatekeeper devices through the procedure outlined in the *EMC Solutions Enabler Array Management CLI User Guide*.

---

To create pseudo-devices and specify devices as gatekeepers and BCV devices:

1. Execute the `ioscan` command and find the full pathnames of the gatekeeper and BCV devices.

For example, the full pathname of the array volume designated to be the gatekeeper is `/dev/rdisk/c1t2d1`.

2. Enter the `lsdev` command and note the output. For example:

```
lsdev -d spt0
Character      Block   Driver   Class
      80          -1     spt0     spt
```

---

**Note:** The wide SCSI Pass-Thru is identified as spt0. If there is no output response to this command, the spt0 driver is missing. Install the proper driver before proceeding.

---

---

**Note:** There is also an spt driver. The spt driver will not work in this environment.

---

3. Create the device node for the gatekeeper device.

---

**Note:** This step creates a pseudo-device that is incapable of functioning like a normal device. It can only be used as a gatekeeper device or to process TimeFinder control functions directed to a BCV device.

---

For example, to create the device node:

```
mknod /dev/rdsk/pseudo_c1t2d1 c 80 0x012100
```

where:

`/dev/rdsk/pseudo_c1t2d1` is the full pathname of the pseudo-device associated with `/dev/rdsk/c1t2d1`.

`c` specifies character (raw) device node creation.

`80` is the character value from the output of the `lsdev` command. This is the major number of the device file.

`0x012100` is the minor number of the device file. The individual values of the minor number are:

`0x` indicates that the number is hexadecimal.

`01` is the hexadecimal number of the controller referenced by `/dev/rdsk/c1t2d1`

2 is the hexadecimal number of the target ID referenced by `/dev/rdisk/c1t2d1`

1 is the hexadecimal number of the LUN referenced by `/dev/rdisk/c1t2d1`

00 must be the last two digits of the minor number.

- Repeat step 3 for all BCV devices and alternate gatekeeper devices.

**Do not perform I/O through the device (`/dev/rdsk/cxtxdx`) associated with the pseudo-device, nor use the pseudo-device as a normal device. If you do, you have two paths to the same device from two different device drivers. Unknown results may occur.**

- To create the mapping information of standard devices to pseudo-devices, create the file:

```
/var/symapi/config/pseudo_devices
```

For each gatekeeper and BCV device, add a mapping to a pseudo-device. For example, in the `pseudo_devices` file, add the following line to map the pseudo-device filename (in **bold**), to the array device file:

```
/dev/rdsk/c1t0d0      /dev/rdsk/pseudo_c1t0d0
```

SYMAPI will then use this pseudo-device instead of the physical device file name.

When the `SymDiscover()` function is used, the pseudo-device mappings get posted in the log file (`/var/symapi/log/symapi*.log`).

## swverify command not supported

The native UNIX command `swverify` is not supported from Solutions Enabler V7.6 and higher and will fail with the following error:

```
# swverify SYMCLI:/opt/emc
===== 04/22/13 10:38:22 EDT BEGIN verify AGENT SESSION (pid=26939)

## HP OpenVMS-specific issues

The default client/server communication security level is SECURE (on platforms that will support it). This can cause communication failures between OpenVMS hosts and non OpenVMS hosts since OpenVMS does not support secure communication. To work around this, you must change the security level on the host which the OpenVMS CLI commands will connect (SYMCLI\_CONNECT) to ANY. For instructions, refer to the *EMC VMAX Family Security Configuration Guide*.

## IBM AIX-specific issues

This section describes the IBM AIX system issues concerned with Oracle database mapping and rebooting a system.

### Oracle database mapping

Oracle 8 database mapping with SYMCLI is supported on 32-bit AIX V4.3 and above.

You may need to create the Oracle library, `libclntsh.so`.

To determine if the library exists for Oracle 8, execute the following:

```
ls $ORACLE_HOME/lib/libclntsh.so
```

If the library does not exist, execute the following command:

```
make -f $ORACLE_HOME/rdbms/lib/ins_rdbms.mk client_sharedlib
```

The Oracle 8 OCI executable is linked dynamically. You must set the following environment variable as follows:

```
setenv LIBPATH $ORACLE_HOME/lib
```

### BCV devices lost after reboot

When a system comes back up after a reboot, it will not recognize your mapped BCVs. To work around this problem, you should run the following special BCV script (`mkbcv`):

```

cd /
./inq.AIX | more (look for no gaps in the numbers, ie.. rhdisk0,
rhdisk1, rhdisk3... - rhdisk2 is missing)
cd /usr/lpp/Symmetrix/bin
./mkbcv -a ALL
cd /

```

```
./inq.AIX | more (look for no gaps in the numbers, ie.. rhdisk0,  
rhdisk1, rhdisk2... - rhdisk2 is not missing)
```

It is recommended to have `./mkbcv -a ALL` in your AIX boot procedures.

---

**Note:** `inq.AIX` can be found on the EMC FTP site.

---

# APPENDIX E

## Solutions Enabler Directories

This appendix contains the directory list for UNIX and Windows installations:

- ◆ UNIX directories ..... 324
- ◆ Windows directories ..... 325
- ◆ OpenVMS directories ..... 326
- ◆ z/OS Unix System Services directories ..... 326

## UNIX directories

Table 44 lists the directories for UNIX platforms. Your directories may differ from this list since the location of these directories is configurable at installation.

**Table 44** UNIX directories

Contents	Directories	Details
Binaries for executables	/usr/storapi/storbin /usr/storapi/bin	STORCLI binaries. SYMCLI binaries.
Shared libraries	/usr/storapi/shlib	All shared libraries.
Database engines	/usr/storapi/shlib/sql/IBMUDB/ /usr/storapi/shlib/sql/ORACLE/ /usr/storapi/shlib/sql/SYBASE/	IBM database engine. Oracle database engine. Sybase database engine.
Language interfaces	/usr/storapi/interfaces/java/ /usr/storapi/interfaces/xml/	Java language interface. XML examples.
SYMCLI manpages	/usr/symcli/storman/man3 /usr/symcli/man/man1 /usr/symcli/man/man3	STORCLI and STORAPI man pages. SYMCLI man pages. SYMAPI and CLARAPI man pages.
SYMAPI Message Catalogs	/usr/storapid/locales/en	SYMAPI Error Message Catalog for English.
Daemons	/usr/symcli/daemons/	Location of the daemon executables.
Configuration database file(s)	/var/symapi/db/	Contains the configuration database file(s) for SYMAPI, CLARAPI, and STORAPI.
SYMAPI environment and system files	/var/symapi/config	Includes licenses, avoidance, options, daemon_options, daemon_users, and nethost files. It is recommended that you back up this directory frequently.
SYMAPI certificate files	/var/symapi/config/cert	Contains server and trusted certificate files and support files for certificate creation. Used for client/server security.
Security data	/var/symapi/authz_cache	Acts as a cache of authorization data from attached storage arrays.
Log files	/var/symapi/log	Contains SYMAPI logs and daemon logs.

# Windows directories

Table 45 lists the default directories for Windows. Your directories may differ from this list since the location of these directories is configurable at installation.

**Table 45** Windows directories

Contents	Directories	Details
Binaries for executables	C:\Program Files\EMC\SYMCLI\storbin C:\Program Files\EMC\SYMCLI\bin	STORCLI binaries. SYMCLI binaries.
Shared libraries	C:\Program Files\EMC\SYMCLI\shlib	All shared libraries.
Database engines	C:\Program Files\EMC\SYMCLI\shlib\sql\Oracle C:\Program Files\EMC\SYMCLI\shlib\sql\SQLSERVER C:\Program Files\EMC\SYMCLI\shlib\sql\ASM	Oracle database engine. SQL server database engine. ASM database engine.
Language interfaces	C:\Program Files\EMC\SYMCLI\interfaces\java C:\Program Files\EMC\SYMCLI\interfaces\xml\examples C:\Program Files\EMC\SYMCLI\interfaces\xml\docs	Java language interface, JAVA and jar files. XML examples. XML docs.
SYMCLI manpages	C:\Program Files\EMC\SYMCLI\storman\man3 C:\Program Files\EMC\SYMCLI\man\man1 C:\Program Files\EMC\SYMCLI\man\man3	STORCLI and STORAPI man pages. SYMCLI man pages. SYMAPI and CLARAPI man pages.
Daemons	C:\Program Files\EMC\SYMCLI\daemons	Location of the daemon executables.
SYMAPI Message Catalogs	C:\Program Files\EMC\SYMCLI\locales\en	Location of the SYMAPI Error Message Catalog for English.
Configuration database file(s)	C:\Program Files\EMC\SYMAPI\db	Contains the configuration database file(s) for SYMAPI, CLARAPI, and STORAPI.
SYMAPI environment and system files	C:\Program Files\EMC\SYMAPI\config	Includes licenses, avoidance, options, and server network files. It is recommended that you back up this directory frequently.
SYMAPI certificate files	C:\Program Files\EMC\SYMAPI\config\cert	Contains server and trusted certificate files and support files for certificate creation. Used for client/server security.
Security data	C:\Program Files\EMC\SYMAPI\authz_cache	Acts as a cache of authorization data from attached storage arrays.
SYMAPI log files	C:\Program Files\EMC\SYMAPI\log	Contains SYMAPI logs and daemon logs.
Providers	C:\Program Files\EMC\SYMCLI\shlib	VSS and VDS providers.
Installer logs files	C:\Program Files\EMC\SYMAPI\InstallerLogs %TEMP%\SE_RTinstall_Verbose.log	Contains all installation related files.
Provider SMI	C:\Program Files\EMC\ECIM	Contains all ECOM related files.
Debug log files	C:\Program Files\EMC\SYMAPI\Debug	Contains Debug log files.

## OpenVMS directories

Table 46 lists the default directories for OpenVMS. Your directories may differ from this list since the location of these directories is configurable at installation.

**Table 46** OpenVMS directories

Contents	Directories	Details
Binaries for executables	SYMCLI\$BIN	STORCLI binaries. SYMCLI binaries.
Shared libraries	SYMCLI\$SHLIB	All shared libraries.
SYMCLI man pages	SYMCLI\$HELP	STORCLI man pages. STORAPI man pages. SYMCLI man pages. SYMAPI and CLARAPI man pages.
SYMAPI Message Catalogs	EMC\$ROOT:[emc.symcli.locales.en]	Location of the SYMAPI Error Message Catalog for English.
Configuration database file(s)	SYMAPI\$DB	Contains the configuration database file(s) for SYMAPI, CLARAPI, and STORAPI.
SYMAPI environment and system files	SYMAPI\$CONFIG	Includes licenses, avoidance, options, <code>daemon_options</code> , and <code>netcnfg</code> files. It is recommended that you back up this directory frequently.
SYMAPI log files	SYMAPI\$LOG	Contains SYMAPI logs and daemon logs.

## z/OS Unix System Services directories

Table 47 lists the Unix System Services directories for z/OS. Your directories may differ from this list since the location of these directories is configurable at installation.

**Table 47** z/OS directories

Contents	Directories	Details
Configuration database file(s)	<code>/var/symapi/db/</code>	Contains the configuration database file(s) for SYMAPI, CLARAPI, and STORAPI.
SYMAPI environment and system files	<code>/var/symapi/config</code>	Includes licenses, avoidance, options, <code>daemon_options</code> , <code>daemon_users</code> , and <code>nethost</code> files. It is recommended that you back up this directory frequently.
SYMAPI certificate files	<code>/var/symapi/config/cert</code>	Contains server and trusted certificate files and support files for certificate creation. Used for client/server security.
Security data	<code>/var/symapi/authz_cache</code>	Acts as a cache of authorization data from attached storage arrays.
Log files	<code>/var/symapi/log</code>	Contains SYMAPI logs and daemon logs.
SYMAPI Message Catalogs	<code>/usr/storapi/locales/en</code>	Contains the SYMAPI Error Message Catalog for English.

# APPENDIX F

## UNIX Installation Log Files

This appendix describes the UNIX log files created by the Solutions Enabler install script:

- ◆ [Understanding the UNIX installer log files.....](#) 328

## Understanding the UNIX installer log files

The Solutions Enabler installer script `se8030_install.sh` creates log files in install root directory `/opt/emc/logs`.

### Format

The log files are named using the following convention:

```
SE_NI_<V M.m.P>_<TimeStamp>.log
```

For example:

```
SE_NI_V8.0.3.110525_175707.log
```

Where:

SE	Solutions Enabler
NI	Native installation
V	Letter portion of version
M	Version major
m	Version minor
P	Version point
TimeStamp	File creation time stamp in the format: <i>yymmdd_hhmmss</i>

### Log file contents

The log files contain the following information:

- ◆ Date
- ◆ Script name
- ◆ User running the script
- ◆ Operating system and hardware type
- ◆ Script command line options
- ◆ Location of native install (NI) kit if the kit is found
- ◆ Previous Install root directory
- ◆ Previous working root directory
- ◆ Install root directory
- ◆ Minimum operating system version required
- ◆ Existing operating system version in system
- ◆ Installed product version
- ◆ Current product Version
- ◆ Selected components
- ◆ Information on active processes (if any)
- ◆ Information on active daemons (if any)
- ◆ Information on active components
- ◆ Package/fileset/rpm being installed/uninstalled
- ◆ List of files installed by package/fileset/rpm only during install
- ◆ Successful completion of install /uninstall

---

**Note:** In addition to the above information, the log files will also contain operating system-specific information useful in trouble shooting native installations.

---
